THE ENDOCRINE SOCIETY®
Mealtime insulin therapy matters inside the body. But it first needs to fit your patient’s life. Choose Humalog and the MiniMed Paradigm® REAL-Time Revel™ Insulin Pump for adult patients with type 1 diabetes ready to have a conversation about using an insulin pump.

• Humalog® (100 units/mL) can be used in a Paradigm Revel Insulin Pump.

Indication for Humalog
• Humalog is an insulin analog indicated to improve glycemic control in adults and children with diabetes mellitus.

Select Safety Information for Humalog
• Humalog is contraindicated during episodes of hypoglycemia and in patients who are hypersensitive to Humalog or any of its excipients.
• Closely monitor blood glucose in all patients treated with insulin. Change insulin regimens cautiously.
• Hypoglycemia is the most common adverse effect of Humalog therapy. The risk of hypoglycemia increases with tighter glycemic control. Severe hypoglycemia may be life threatening and can cause seizures or death.
• Humalog should be given within 15 minutes before or immediately after a meal.

Select Safety Information for Humalog, continued
• Humalog should not be diluted or mixed when used in an external insulin pump. Change Humalog in the reservoir at least every 7 days. Change the infusion set and insertion site at least every 3 days.
• Catheter occlusions and infusion-site reactions have been reported in patients receiving Humalog as a continuous subcutaneous infusion.

Reference

For more information about Humalog, please call The Lilly Answers Center at 1-800-LillyRx (1-800-545-5979), or visit www.Humalog.com. For more information about Paradigm® REAL-Time Revel™, please call Medtronic at 1-888-350-3199, or visit www.medtronicdiabetes.com.

Save the Date for ENDO 2013

Join us for ENDO 2013, The Endocrine Society’s 95th Annual Meeting & Expo, in the beautiful city by the bay.

ENDO 2013
JUNE 15–18
SAN FRANCISCO
THE ENDOCRINE SOCIETY’S 95TH ANNUAL MEETING & EXPO

Registration opens in the fall of 2012.

For more information about Humalog, please call The Lilly Answers Center at 1-800-LillyRx (1-800-545-5979), or visit www.Humalog.com. For more information about Paradigm® REAL-Time Revel™, please call Medtronic at 1-888-350-3199, or visit www.medtronicdiabetes.com.
Important Safety Information for Humalog

Contraindications
- Humalog® is contraindicated during episodes of hypoglycemia and in patients who are hypersensitive to Humalog or any of its excipients.

Warnings and Precautions
- **Dose Adjustment and Monitoring:** Closely monitor blood glucose in all patients treated with insulin. Change insulin regimens cautiously. Concomitant oral antidiabetic treatment may need to be adjusted.

- **Hypoglycemia:** Hypoglycemia is the most common adverse effect of Humalog. The risk of hypoglycemia increases with tighter glycemic control. Educate patients to recognize and manage hypoglycemia. Hypoglycemia can happen suddenly and symptoms may vary for each person and may change over time. Early warning symptoms of hypoglycemia may be different or less pronounced under conditions such as long-standing diabetes, diabetic nerve disease, use of medications such as beta-blockers, or intensified diabetes control. These situations may result in severe hypoglycemia and possibly loss of consciousness prior to the patient’s awareness of hypoglycemia. Severe hypoglycemia may be life threatening and can cause seizures or death.

- Use caution in patients with hypoglycemia unawareness and who may be predisposed to hypoglycemia. The patient’s ability to concentrate and react may be impaired as a result of hypoglycemia. Rapid changes in serum glucose levels may induce symptoms similar to hypoglycemia in persons with diabetes, regardless of the glucose value.

- **Allergic Reactions:** Severe, life-threatening, generalized allergy, including anaphylaxis, can occur with Humalog.

- **Hypokalemia:** Humalog can cause hypokalemia, which, if untreated, may result in respiratory paralysis, ventricular arrhythmia, and death. Use caution in patients who may be at risk for hypokalemia (e.g., patients using potassium-lowering medications or medications sensitive to serum potassium concentrations).

- **Mixing of Insulins:** Humalog for subcutaneous injection should not be mixed with insulins other than NPH insulin. If Humalog is mixed with NPH insulin, Humalog should be drawn into the syringe first. Injection should occur immediately after mixing.

- **Subcutaneous Insulin Infusion Pump:** Humalog should not be diluted or mixed when used in an external insulin pump. Change Humalog in the reservoir at least every 7 days. Change the infusion set and insertion site at least every 3 days.

- **Drug Interactions:** Some medications may alter glucose metabolism, insulin requirements, and the risk for hypoglycemia or hyperglycemia. Signs of hypoglycemia may be reduced or absent in patients taking anti-adrenergic drugs. Particularly close monitoring may be required.

- **Adverse Reactions:**
  - Adverse reactions associated with Humalog include hypoglycemia, hypokalemia, allergic reactions, injection-site reactions, lipodystrophy, pruritus, rash, weight gain, and peripheral edema.

- **Use in Specific Populations**
  - **Pediatrics:** Humalog has not been studied in children with type 1 diabetes less than 3 years of age or in children with type 2 diabetes.

- **Dosage and Administration**
  - Humalog should be given within 15 minutes before or immediately after a meal.

Please see following pages for Brief Summary of Full Prescribing Information for Humalog.

HI HCP ISI 08JUN2011
MiniMed Paradigm® REAL-Time Revel™ Insulin Pump

Indications for Use

Pump

- The Paradigm Revel insulin pump is indicated for the continuous delivery of insulin, at set and variable rates, for the management of diabetes mellitus in persons requiring insulin.

MiniMed Paradigm REAL-Time Revel Insulin Pump

Important Safety Information

Contraindications

- Pump therapy is not recommended for people who are unwilling or unable to perform a minimum of four blood glucose tests per day and to maintain contact with their healthcare professional. Successful insulin pump therapy requires sufficient vision or hearing to allow recognition of the pump signals and alarms.

Warnings

- The pump is not suitable for use in the presence of a flammable anesthetic mixture with air, oxygen, or nitrous oxide.

- Standard Luer sets are not compatible with the Medtronic MiniMed Paradigm pump. Medtronic Paradigm reservoirs and Paradigm-compatible infusion sets are specifically designed for use with the pump.

- Do not modify your Paradigm reservoir or Paradigm-compatible infusion set.

- Do not put any other drugs/medications inside your reservoir to use with this pump. Only insulin that has been prescribed by your physician can be used in this pump.

- Do not use pump cases that have a magnetic clasp.

- Do not expose your insulin pump to MRI equipment or other devices that generate very strong magnetic fields. The magnetic fields in the immediate vicinity of these devices can damage the part of the pump’s motor that regulates insulin delivery, possibly resulting in over-delivery and severe hypoglycemia. Your pump must be removed and kept outside the room during magnetic resonance imaging (MRI) procedures.

- If your pump is inadvertently exposed to a strong magnetic field, discontinue use and contact our 24-Hour HelpLine for further assistance.

Please visit http://www.medtronicdiabetes.com/about/safety.html for complete safety information.

CareLink® is a registered trademark of Medtronic MiniMed, Inc.

The MiniMed Paradigm Revel Insulin Pump is Continuous Glucose Monitoring (CGM) ready. Optional glucose sensor and MiniLink® REAL-Time transmitter are available separately from Medtronic.

For information on the MiniMed Paradigm Revel Insulin Pump integrated with CGM, please contact your Medtronic representative.

Please see Important Safety Information for Humalog on opposite page.
Humalog® (insulin lispro injection, USP [rDNA origin])

Brief Summary: Consult the package insert for complete prescribing information.

INDICATIONS AND USAGE
Humalog is an insulin analog indicated to improve glycemic control in adults and children with diabetes mellitus.

CONTRAINDICATIONS
Humalog is contraindicated:
- during episodes of hypoglycemia
- in patients who are hypersensitive to HUMALOG or to any of its excipients.

WARNINGS AND PRECAUTIONS
Dose Adjustment and Monitoring—Glucose monitoring is essential for patients receiving insulin therapy. Changes to an insulin regimen should be made cautiously and only under medical supervision. Changes in insulin strength, manufacturer, type, or method of administration may result in the need for a change in insulin dose. Concomitant oral antidiabetic therapy may need to be adjusted.

As with all insulin preparations, the time course of action for HUMALOG may vary in different individuals or at different times in the same individual and is dependent on many conditions, including the site of injection, local blood supply, or local temperature. Patients who change their level of physical activity or meal plan may require adjustment of insulin doses.

Hypoglycemia—Hypoglycemia is the most common adverse effect associated with insulin regimens, including HUMALOG. The risk of hypoglycemia increases with tighter glycemic control. Patients must be educated to recognize and manage hypoglycemia. Hypoglycemia can happen suddenly and symptoms may be different for each person and may change from time to time. Severe hypoglycemia can cause seizures and may be life-threatening or cause death.

The timing of hypoglycemia usually reflects the time-action profile of the administered insulin formulations. Other factors such as changes in food intake (e.g., amount of food or timing of meals), injection site, exercise, and concomitant medications may also alter the risk of hypoglycemia [see Drug Interactions].

As with all insulins, use caution in patients with hypoglycemia unawareness and in patients who may be predisposed to hypoglycemia (e.g., the pediatric population and patients who fast or have erratic food intake). The patient’s ability to concentrate and react may be impaired as a result of hypoglycemia. This may present a risk in situations where these abilities are especially important, such as driving or operating other machinery.

Rapid changes in serum glucose levels may induce symptoms similar to hypoglycemia in patients with diabetes, regardless of the glucose value. Early warning symptoms of hypoglycemia may be different or less pronounced under certain conditions, such as longstanding diabetes, diabetic nerve disease, use of medications such as beta-blockers [see Drug Interactions], or intensified diabetes control. These situations may result in severe hypoglycemia (and, possibly, loss of consciousness) prior to the patient’s awareness of hypoglycemia.

Hypersensitivities and Allergic Reactions—Severe, life-threatening, generalized allergy, including anaphylaxis, can occur with insulin products, including Humalog [see Adverse Reactions].

Hypokalemia—All insulin products, including HUMALOG, cause a shift in potassium from the extracellular to intracellular space, possibly leading to hypokalemia. Untreated hypokalemia may cause respiratory paralysis, ventricular arrhythmia, and death. Use caution in patients who may be at risk for hypokalemia (e.g., patients using potassium-lowering medications, patients taking medications sensitive to serum potassium concentrations).

Renal or Hepatic Impairment—Frequent glucose monitoring and insulin dose reduction may be required in patients with renal or hepatic impairment.

Mixing of Insulins—HUMALOG for subcutaneous injection should not be mixed with insulin preparations other than NPH insulin. If HUMALOG is mixed with NPH insulin, HUMALOG should be drawn into the syringe first. Injection should occur immediately after mixing.

Do not mix HUMALOG with other insulins for use in an external subcutaneous infusion pump.

Subcutaneous Insulin Infusion Pumps—When used in an external insulin pump for subcutaneous infusion, HUMALOG should not be diluted or mixed with any other insulin. Change the HUMALOG in the reservoir at least every 7 days, change the infusion sets and the infusion set insertion site at least every 3 days. HUMALOG should not be exposed to temperatures greater than 58.6°F (33°C), Malfuction of the insulin pump or infusion set or insulin degradation can rapidly lead to hyperglycemia and ketosis. Prompt identification and correction of the cause of hyperglycemia or ketosis is necessary. Interim subcutaneous injections with HUMALOG may be required. Patients using continuous subcutaneous insulin infusion pump therapy must be trained to administer insulin by injection and have alternate insulin therapy available in case of pump failure [see Dosage and Administration and How Supplied/Storage and Handling].

Drug Interactions—Some medications may alter insulin requirements and the risk for hypoglycemia or hyperglycemia [see Drug Interactions].

ADVERSE REACTIONS
The following adverse reactions are discussed elsewhere:
- Hypoglycemia [see Warnings and Precautions].
- Hypokalemia [see Warnings and Precautions].

Clinical Trial Experience—Because clinical trials are conducted under widely varying designs, the adverse reaction rates reported in one clinical trial may not be easily compared with those rates reported in another clinical trial, and may not reflect the rates actually observed in clinical practice.

The frequencies of Treatment-Emergent Adverse Events during HUMALOG clinical trials in patients with type 1 diabetes mellitus and type 2 diabetes mellitus are listed in the tables below.

Table 1: Treatment-Emergent Adverse Events in Patients with Type 1 Diabetes Mellitus

Insulin initiation and intensification of glucose control

Intensification or rapid improvement in glucose control has been associated with a transitory, reversible ophthalmologic refraction disorder, worsening of diabetic retinopathy, and acute painful peripheral neuropathy. However, long-term glycemic control decreases the risk of diabetic retinopathy and neuropathy.

Lipodyphrosis

Long-term use of insulin, including HUMALOG, can cause lipodyrophy at the site of repeated insulin injections or infusion. Lipodyrophy includes lipohypertrophy (thickening of adipose tissue) and lipatrophy (thinning of adipose tissue), and may affect insulin absorption. Rotate insulin injection or infusion sites within the same region to reduce the risk of lipodyrophy [see Dosage and Administration].

Weight gain

Weight gain can occur with insulin therapy, including HUMALOG, and has been attributed to the anabolic effects of insulin and the decrease in glucosuria.

Peripheral Edema

Insulin, including HUMALOG, may cause sodium retention and edema, particularly if previously poor metabolic control is improved by intensified insulin therapy.

Adverse Reactions with Continuous Subcutaneous Insulin Infusion (CSI)

In a 12-week, randomized, crossover study in adult patients with type 1 diabetes (n=39), the rates of catheter occlusions and infusion site reactions were similar for HUMALOG and regular human insulin treated patients (see Table 3).
Some medications may alter insulin requirements and the risk for available in case of pump failure.

Renal or Hepatic Impairment—hypokalemia may cause respiratory paralysis, ventricular arrhythmia, and death. Use Hypersensitivity and Allergic Reactions— longstanding diabetes, diabetic nerve disease, use of medications such as beta-blockers, clonidine, lithium salts, and alcohol. Pentamidine may cause hypoglycemia, which may sometimes be followed by hyperglycemia.

Postmarket Experience—The following additional adverse reactions have been identified during post-approval use of HUMALOG. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Medication errors in which other insulins have been accidentally substituted for HUMALOG have been identified during postapproval use.

DRUG INTERACTIONS A number of drugs affect glucose metabolism and may require insulin dose adjustment and particularly close monitoring.

Following are some of the examples:

- Drugs That May Increase the Blood-Glucose-Lowering Effect of HUMALOG and Susceptibility to Hypoglycemia: Oral anti-diabetic agents, salicylates, sulfonamide antibiotics, monamine oxidase inhibitors, fluoxetine, pramipexine, propoxyphene, pentoxyfylline, ACE inhibitors, angiotensin II receptor blocking agents, and somatostatin analogs (e.g., octreotide)
- Drugs That May Reduce the Blood-Glucose-Lowering Effect of HUMALOG: corticosteroids, isoniazid, niacin, estrogens, oral contraceptives, phenothiazines, danazol, diuretics, sympathomimetic agents (e.g., ephedrine, albuterol, terbutaline), sympatholytic agents (e.g., clonidine, guanethidine, prazocin), thyroid hormones.
- Drugs That May Increase or Reduce the Blood-Glucose-Lowering Effect of HUMALOG: beta-blockers, clonidine, lithium salts, and alcohol. Pentamidine may cause hypoglycemia, which may sometimes be followed by hyperglycemia.
- Drugs That May Reduce the Signs of Hypoglycemia: beta-blockers, clonidine, guanethidine, and resepine.

USE IN SPECIFIC POPULATIONS Pregnancy—Pregnancy Category B. All pregnancies have a background risk of birth defects, loss, or other adverse outcome regardless of drug exposure. This background risk is increased in pregnancies complicated by hyperglycemia and may be decreased with good metabolic control. It is essential for patients with diabetes or history of gestational diabetes to maintain good metabolic control before conception and throughout pregnancy. In patients with diabetes or gestational diabetes insulin requirements may decrease during the first trimester, generally increase during the second and third trimesters, and rapidly decline after delivery. Careful monitoring of glucose control is essential in these patients. Therefore, female patients should be advised to tell their physicians if they intend to become, or if they become pregnant while taking HUMALOG.

Although there are limited clinical studies of the use of HUMALOG in pregnancy, published studies with human insulin suggest that optimizing overall glycemic control, including postprandial control, before conception and during pregnancy improves fetal outcome.

In a combined fertility and embryo-fetal development study, female rats were given subcutaneous insulin lispro injections of 5 and 20 units/kg/day (0.8 and 3.6 times the human subcutaneous dose of 1 unit/kg/day, based on units/body surface area, respectively) from 8 weeks prior to copulation through Gestation Day 19. There were no adverse effects on female fertility, implantation, or fetal viability and morphology. However, fetal growth retardation was produced at the 20 units/kg/day-dose as indicated by decreased fetal weight and an increased incidence of fetal runts/fetuses.

In an embryo-fetal development study in pregnant rabbits, insulin lispro doses of 0.1, 0.25, and 0.75 unit/kg/day (0.03, 0.08, and 0.24 times the human subcutaneous dose of 1 unit/kg/day, based on units/body surface area, respectively) were injected subcutaneously on Gestation days 7 through 19. There were no adverse effects on fetal viability, weight, and morphology at any dose.

Nursing Mothers—It is unknown whether insulin lispro is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when HUMALOG is administered to a nursing woman. Use of HUMALOG is compatible with breastfeeding, but women with diabetes who are lactating may require adjustments of their insulin doses.

Pediatric Use—HUMALOG is approved for use in children for subcutaneous daily injections and for subcutaneous continuous infusion by external insulin pump. HUMALOG has not been studied in pediatric patients younger than 3 years of age. HUMALOG has not been studied in pediatric patients with type 2 diabetes.

As in adults, the dosage of HUMALOG must be individualized in pediatric patients based on metabolic needs and results of frequent monitoring of blood glucose.

Geriatric Use—Of the total number of subjects (n=2834) in eight clinical studies of HUMALOG, twelve percent (n=338) were 65 years of age or over. The majority of these had type 2 diabetes. HbA1c values and hypoglycemia rates did not differ by age.

Pharmacokinetic/pharmacodynamic studies to assess the effect of age on the onset of HUMALOG action have not been performed.

OVERDOSAGE Excess insulin administration may cause hypoglycemia and hypokalemia. Mild episodes of hypoglycemia usually can be treated with oral glucose. Adjustments in drug dosage, meal patterns, or exercise may be necessary. More severe episodes with coma, seizure, or neurologic impairment may be treated with intramuscular/subcutaneous glucagon or concentrated intravenous glucose. Sustained carbohydrate intake and observation may be necessary because hypoglycemia may recur after apparent clinical recovery. Hypokalemia must be corrected appropriately.

DOSE AND ADMINISTRATION Dosage Considerations—When given subcutaneously, HUMALOG has a more rapid onset of action and a shorter duration of action than regular human insulin. The dosage of HUMALOG must be individualized. Blood glucose monitoring is essential in all patients receiving insulin therapy.

The total daily insulin requirement may vary and is usually between 0.5 to 1 unit/kg/day. Insulin requirements may be altered during stress, major illness, or with changes in exercise, meal patterns, or coadministered drugs.

Subcutaneous Administration—HUMALOG should be given within 15 minutes before a meal or immediately after a meal. HUMALOG given by subcutaneous injection should generally be used in regimens with an intermediate- or long-acting insulin.

HUMALOG administered by subcutaneous injection should be given in the abdominal wall, thigh, upper arm, or buttocks. Injection sites should be rotated within the same region (abdomen, thigh, upper arm, or buttocks) from one injection to the next to reduce the risk of lipodystrophy [see Adverse Reactions]. Change the HUMALOG in the reservoir at least every 7 days, change the infusion sets and the infusion site insertion set at least every 3 days.

The initial programming of the external insulin infusion pump should be based on the total daily insulin dose of the previous regimen. Although there is significant variability among patients, approximately 50% of the total dose is usually given as meal-related boluses of HUMALOG and the remainder is given as a basal infusion. HUMALOG is recommended for use in pump systems suitable for insulin infusion such as MiniMed, Disetronic, and other equivalent pumps.

HOW SUPPLIED/STORAGE AND HANDLING How Supplied HUMALOG 100 units per ml (U-100) is available as:

- 10 ml vials NDC 0002-7510-01 (VL-7510)
- 3 ml vials NDC 0002-7510-17 (VL-7533)
- 5 x 3 ml cartridges1 NDC 0002-7516-59 (VL-7516)
- 5 x 3 ml prefilled pen NDC 0002-8725-59 (HP-8725)
- 5 x 3 ml HUMALOG KwikPen® NDC 0002-8799-59 (HP-8799)

Storage Do not use after the expiration date. Unopened HUMALOG should be stored in a refrigerator (36°F to 46°F [2°C to 8°C]), but not in the freezer. Do not use HUMALOG if it has been frozen. In-use HUMALOG vials, cartridges, pens, and HUMALOG KwikPen® should be stored at room temperature.

</table>
below 86°F (30°C) and must be used within 28 days or be discarded, even if they still contain HUMALOG. Protect from direct heat and light. See table below:

| 10 mL vial | 28 days | Until expiration date | 28 days, refrigerated/room temperature. |
| 3 mL vial | 28 days | Until expiration date | 28 days, refrigerated/room temperature. |
| 3 mL cartridge | 28 days | Until expiration date | 28 days. Do not refrigerate. |
| 3 mL prefilled pen | 28 days | Until expiration date | 28 days. Do not refrigerate. |
| 3 mL Humalog KwikPen (prefilled) | 28 days | Until expiration date | 28 days. Do not refrigerate. |

Use in an External Insulin Pump — Change the HUMALOG in the reservoir at least every 7 days, change the infusion sets and the infusion set insertion site at least every 3 days or after exposure to temperatures that exceed 96.8°F (37°C). A HUMALOG 3 mL cartridge used in the D-Tro® pumps should be discarded after 7 days, even if it still contains HUMALOG. However, as with other external insulin pumps, the infusion set should be replaced and a new infusion set insertion site should be selected at least every 3 days.

Diluted HUMALOG for Subcutaneous Injection — Diluted HUMALOG may remain in patient use for 28 days when stored at 41°F (5°C) and for 14 days when stored at 86°F (30°C). Do not dilute HUMALOG contained in a cartridge or HUMALOG used in an external insulin pump.

Preparation and Handling
Diluted HUMALOG for Subcutaneous Injection — HUMALOG may be diluted with Sterile Diluent for HUMALOG for subcutaneous injection. Diluting one part HUMALOG to nine parts diluent will yield a concentration one-tenth that of HUMALOG (equivalent to U-10). Diluting one part HUMALOG to one part diluent will yield a concentration one-half that of HUMALOG (equivalent to U-50).

PATIENT COUNSELING INFORMATION: See FDA-approved patient labeling and Patient Counseling Information section of the Full Prescribing Information.

Support For Young Professionals

Dear Colleagues:

The Endocrine Society continues its strong commitment to preparing future endocrine leaders by creating career development programming that has substantial impact on young professionals pursuing careers in endocrinology. The Society has a trainee membership of nearly 3,000 and provides a strong portfolio of programs aimed at supporting trainees’ work at the cutting edge of research and practice. The portfolio of career development programming has been enhanced by including curricula to address critical issues for junior faculty and mid-career professionals.

Programming for Early- and Mid-Career Professionals at ENDO 2012

ENDO 2012, held in Houston, was highlighted by dynamic programming for young professionals in our field. The 6th Annual Endocrine Trainee Day Workshop, co-sponsored by Women in Endocrinology, hosted more than 230 trainees who attended interactive sessions in clinical and basic science tracks. These sessions were hosted by preeminent leaders in the field and began a series of activities specifically designed to meet the needs of trainees.

The very popular Career Development Workshops featured new sessions this year, including the half-day workshop, “How to Secure Promotion and Tenure for Junior Faculty and Mid-Career Professionals,” and the “Writing a Successful R01 and Other Independent Research Grant Applications: Tips for the Mid-Career Professional” evening session.

Trainee posters were identified for special consideration in the Presidential Poster Competition. Many trainees met with old friends and made new connections at the Trainee Reception and used the Trainee Career Center to continue networking with leaders and one another. A new networking event added this year included the Mentor Connection Breakfast, where volunteer mentors who participate in the Society’s Mentor Exchange were available to meet one-on-one with early career professionals seeking advice and mentorship.

2012 Early Investigators Workshop

The Early Investigators Workshop will be held on September 28–29, 2012, in San Francisco. This event will provide an intensive introduction on what it takes to create a successful career in endocrine research for as many as 50 young basic research and clinical trainees. The workshop will offer joint sessions that cover general and translational topics and breakout sessions on topics of specific interest to each track. Session topics will include practical guidance for pursuing NIH funding, how to establish an effective mentor relationship, balancing career and family life, and more. In addition, fellows will receive guidance from Society experts who are on hand to provide constructive feedback on the fellows’ research projects. More details of this workshop are presented in the Trainees and Students section of the Society’s Web site (www.endo-society.org/awards/eiw).

Career Advancement

The Society continues to offer the Mentor Exchange, an online portal for endocrinologists of all experience levels to mentor students, fellows in training, and other members. Society mentors offer a variety of perspectives on the diverse opportunities an endocrinology career affords. More than 110 members have volunteered to be mentors and are available to connect with early-career professionals. Details on becoming a mentor or finding a mentor are on the Mentor Exchange section of the Society’s Web site at www.endo-society.org/mentor. You may also find great tips and career advice on the revamped EndoCareers® Web site at www.endocareers.org. Finally, the new EndoGrants Central™ is a database of funding opportunities of particular interest to the endocrine community. Members may search for grants or post opportunities at www.endo-society.org/awards/EndoGrants/.

In the coming months, the Society will begin the 2013 awards season with calls for applications for the numerous Society awards and travel grants for trainees and early-career professionals. I encourage all those who are eligible to apply.

As you can see, many exciting opportunities exist within The Endocrine Society to promote the development of early-career professionals while building a community where young endocrinologists will thrive.

Most importantly, your opinions and ideas are essential in helping us create quality programming, and I invite you to submit any comments or suggestions to me c/o president@endo-society.org.

Sincerely,

William F. Young, Jr., M.D.
President, The Endocrine Society
Dear Readers,

The people who brought us the sexual revolution of the 1960s are now senior citizens. Many are still going strong—enjoying careers, traveling, playing sports, and, yes, having sex. Although no longer concerned about unwanted pregnancies, this population often needs a refresher course in sex education to deal with today’s sexual issues, Melissa Mapes writes in our cover story. Like the sex and aging seminars cropping up across the country, her story offers a frank discussion of sex among seniors (page 22).

We used to call type 2 diabetes “adult onset,” but the increasing incidence among American youth has widened the scope of the chronic condition and raised awareness of an evolving health problem. How best to treat children with the diseases is a matter of debate and research, free-lancer Eric Seaborg writes (page 32). Because obesity and type 2 diabetes are linked, prevention through exercise and diet is a highly favored strategy. Healthy eating, however, is a daunting challenge, as our story on portion sizes attests. Writer Kelly Horvath reports that some servings are five times larger than they were in 1970. Health advocates offer tips for portion control (page 36).

War brings casualties. The National Museum of Health and Medicine, a repository of military medical history near Washington, D.C., is a reminder of the extraordinary efforts medical personnel make to save lives and care for the wounded. The museum’s history and ongoing service, the focus of our Back Story this month, are well worth exploring (page 54).

Sincerely,

Marian Smith Holmes
Managing Editor
Endocrine News

**ENDOCRINE NEWS ONLINE EXCLUSIVES**

The following articles are housed online only. See Endocrine News Online to read them and find related links (www.endo-society.org/endo_news).

Social Network for Diabetes
A new trial shows that young teens with Type 1 diabetes may benefit from Internet programs.

Caffeine and Pregnancy
The commonly consumed stimulant in coffee, chocolate, and other foods may inhibit a successful pregnancy, research suggests.

No Weigh!
A new study finds that Americans typically underestimate the number of pounds they’ve gained.
Boxers or Briefs and Other Male Fertility Factors

- Boxers or briefs? A light-hearted question often asked of celebrities and politicians may be a critical decision in regards to a man’s fertility. Research from the Universities of Manchester and Sheffield in England, recently published in Human Reproduction [humrep. oxfordjournals.org], shows boxers are better for fertility, but surprisingly, several other lifestyle choices seem to have little effect on sperm motility.

- Men unsuccessfully attempting conception for 12 months were recruited through United Kingdom fertility clinics and assessed for job histories, lifestyle, and health factors. Those with medical conditions or treatments known to cause infertility were excluded. Those chosen to participate were interviewed about clothing choices, recreational drug use, and fertility history.

- Wearing boxers was associated with higher motile sperm concentration (MSC). Previous studies have suggested that tight underwear such as briefs may elevate the temperature of the testicles and slow down production of sperm.

- Low (MSC) occurred in men with previous testicular surgery, possibly due to similar factors found in undescended testicles that reduce fertility. Men doing manual work also had low MSC, and this can be explained, in part, by exposure to toxicants. Students and the unemployed are at a similarly high risk with little explanation as to why.

- MSC was not lowered, however, by smoking, alcohol, or recreational drug use, the study concluded. Although direct changes to sperm were either insignificant or undetected in this study, these habits may affect fertility through other means.

- Dan Kelly

Quality of Life of Pediatric Cancer Patients Better than Expected

- It’s hard to hear of a child with a rare disease but surely harder to live as one. Quality of life (QOL) can suffer from even the stress of diagnosis and treatment. Pediatric differentiated thyroid cancer (DTC) spreads to the cervical lymph nodes in 40–90 percent of patients and metastasizes distantly in 20–30 percent. Despite the aggressiveness of this rare disease, QOL has gone mostly unstudied.

- Researchers at the Hospital for Sick Children in Toronto predicted pediatric DTC patients to have low QOL and high anxiety. Their study, lead by Asaf Oren and to be published in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], found the opposite. Neither age, length of time since diagnosis or therapeutic factors altered anxiety levels and QOL beyond norms in the control group or healthy population.

- Assessed through 3 questionnaires, 16 DTC patients aged 10–18 years measured QOL scores and anxiety levels similar to 16 adolescents with autoimmune hypothyroidism receiving L-thyroxine (L-T4) therapy. L-T4 has been found to increase anxiety during administration with only a slight decrease during withdrawal.

- None of the 16 DTC patients were experiencing withdrawal at the time of the study, and their free T4 levels did not correlate to their scores.

- Recombinant human thyroid stimulating hormone (rhTSH) and L-T4 withdrawal are typically used in follow-up of DTC and use of rhTSH in adult patients has been linked to improved QOL. In this study, no difference was found between the QOL scores of adolescents who received rhTSH and those managed with use of withdrawal L-T4.

- Following up through an endocrinology clinic instead of an oncology clinic might influence these scores, as might discussions of “excellent prognosis.” However, QOL in other long-term pediatric cancer survivors improves from diagnosis to levels similar to those in the healthy population. Compared to healthy siblings, long-term pediatric cancer survivors have scored lower only on assessment of physical well-being. It may well be the ability of children to adapt easily and accentuate the positive that gives adolescent cancer patients a better self-perceived QOL.

- Dan Kelly
Type-2 diabetes is sometimes linked to a patient’s low level of pancreatic β-cells, which control insulin. A new study investigates why some patients have lower pancreatic β-cells than others and whether the differences are genetic or environmental. A team of scientists led by Brigid Gregg, M.D., of Kovler Diabetes Center, University of Chicago, explored whether there is a baseline number of β-cells in humans. They also analyzed if this number is established by birth or if it can change later in life.

The researchers performed immunofluorescence examinations on pancreatic tissue samples from 40 human cadavers between the ages of 23 weeks premature and 72 years. None of the subjects had a personal or family history of diabetes and none were obese. Cell counts and islet size were done on at least 25 sample images from each subject’s pancreatic section.

The study, published in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], found that the highest rate of β-cell creation occurred preterm and up to about 2 years of age. Afterward, the rate of β-cell proliferation dropped to about 0.5 percent.

In the article, the researchers conclude that baseline β-cell population and its link with other islet cell types are established in humans before 5 years of age. They write that genetic factors and the maternal intrauterine environment could influence the degree of human pancreatic islet formation and the size of baseline β-cell mass. If this is small, they report, then a likelihood of developing diabetes can be set very early on in life.

Exercise Increases sRAGE, Benefits Diabetes Patients

Scientists have known for some time that advanced glycation end products (AGEs) and their receptor (RAGE) play an important role in the development of atherosclerosis in patients with type 2 diabetes. New research now reveals that low levels of the soluble form of RAGE (sRAGE)—a critical risk factor for cardiovascular disease—may be improved with exercise.

Exercise helps protect against atherosclerosis by reducing or preventing oxidative stress and systemic inflammation, symptoms exacerbated by AGEs. A team of Korean researchers, led by Kyung Mook Choi, M.D., Ph.D., from the Division of Endocrinology and Metabolism in the College of Medicine at Korea University, Seoul, explored how exercise would affect the levels of sRAGE and its impact on cardiometabolic risk factors.

In their study soon to be published in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], 75 Asian women with T2DM were randomized either into a control or aerobic exercise groups. The patients’ average age was 54.4 years, average body mass index 26.8, and all had a sedentary lifestyle. While the control group continued their normal routines, the exercise group was instructed to walk at a moderate pace for an hour five days per week for 12 weeks. Exercise sessions were monitored every two weeks by a multi-record accelerometer.

After 12 weeks, the exercisers showed significant improvements in many cardiometabolic risk factors, including an increase in aerobic capacity and decreased body weight, waist size, blood pressure, cholesterol levels, glucose levels, and visceral fat area. The exercise group also had increases in sRAGE levels and decreases in high sensitive C-reactive protein levels, another cardiovascular disease risk factor. These decreases were not found in the control group.

The researchers show that sRAGE is a potential mechanism underlying the benefits of exercise in type 2 diabetes patients.

Glenda Fauntleroy

Continued on page 18
BYETTA is indicated as an adjunct to diet and exercise to
improve glycemic control in adults with type 2 diabetes mellitus.
Not a substitute for insulin and should not be used in
patients with type 1 diabetes or diabetic ketoacidosis.
Concurrent use with prandial insulin cannot be
recommended.
Has not been studied in patients with a history of pancreatitis.
It is unknown whether patients with a history of pancreatitis
are at increased risk for pancreatitis while using BYETTA;
consider other antidiabetic therapies for these patients.

Important Safety Information

Contraindications
BYETTA is contraindicated in patients with prior severe
hypersensitivity reactions to exenatide or to any of the
product components.

Warnings and precautions
Based on postmarketing data BYETTA has been
associated with acute pancreatitis, including fatal and
non-fatal hemorrhagic or necrotizing pancreatitis. After
initiation and dose increases of BYETTA, observe patients
carefully for pancreatitis (persistent severe abdominal
pain, sometimes radiating to the back, with or without
vomiting). If pancreatitis is suspected, BYETTA should be
discontinued promptly. BYETTA should not be restarted
if pancreatitis is confirmed.
Increased risk of hypoglycemia when used in combination with
glucose-independent insulin secretagogues (eg, sulfonylureas);
reduction of the sulfonylurea dose may be needed. When used
with insulin, evaluate and consider reducing the insulin dose in
patients at increased risk of hypoglycemia.
Postmarketing reports of increased international normalized ratio
and acute renal failure, sometimes
requiring hemodialysis and kidney transplantation. BYETTA
should not be used in patients with severe renal impairment
or end-stage renal disease. Use with caution in patients with
renal transplantation or when initiating or escalating the
dose in patients with moderate renal failure.
Not recommended in patients with severe gastrointestinal
disease (eg, gastroparesis).
Patients may develop antibodies to exenatide. In 3
registration trials, antibody levels were measured in 90% of
patients, with up to 4% of patients having high-titer
antibodies and attenuated glycemic response. If worsening
of or failure to achieve adequate glycemic control occurs,
consider alternative antidiabetic therapy.
Postmarketing reports of serious hypersensitivity reactions
(eg, anaphylaxis and angioedema). If this occurs, patients should
discontinue BYETTA and other suspect medications and
promptly seek medical advice.
BYETTA added to titrated insulin glargine achieved a significantly greater A1C reduction vs titrated insulin glargine alone

<tr>
<td>ITT population.</td>
</tr>
</tbody>
</table>

Abbreviations: LS, least squares; BL, baseline; ITT, intent to treat.

**Warnings and precautions (cont’d)**

- No clinical studies establishing conclusive evidence of macrovascular risk reduction with BYETTA or any other antidiabetic drug.

**Adverse reactions**

- Most common adverse reactions in registration trials associated with BYETTA vs placebo (PBO): nausea (44% vs 18%), vomiting (13% vs 4%), and diarrhea (13% vs 6%). Other adverse reactions ≥5% and more than PBO: feeling jittery, dizziness, headache, and dyspepsia. With a thiazolidinedione (TZD), adverse reactions were similar; as monotherapy, most common was nausea (8% vs 0%). With insulin glargine: nausea (41% vs 8%), vomiting (18% vs 4%), diarrhea (18% vs 8%), headache (14% vs 4%), constipation (10% vs 2%), dyspepsia (7% vs 2%), asthenia (5% vs 1%).

- Hypoglycemia incidence, BYETTA vs PBO, with metformin (MET): 5.3% (10 mcg) and 4.5% (5 mcg) vs 5.3%; with SFU, 35.7% (10 mcg) and 14.4% (5 mcg) vs 3.3%; with MET + SFU, 27.8% (10 mcg) and 19.2% (5 mcg) vs 12.6%; with TZD, 10.7% (10 mcg) vs 7.1%; as monotherapy, 3.8% (10 mcg) and 5.2% (5 mcg) vs 1.3%; with insulin glargine, 24.8% (10 mcg) vs 29.5%.

- Withdrawals: as monotherapy, 2 of 155 BYETTA patients withdrew due to headache and nausea vs 0 PBO; with MET and/or SFU vs PBO, nausea (3% vs <1%) and vomiting (1% vs 0); with TZD + MET, nausea (9%) and vomiting (5%), with <1% of PBO patients withdrawing due to nausea; with insulin glargine vs PBO, nausea (5.1% vs 0), vomiting (2.9% vs 0).

Patients with type 2 diabetes on insulin glargine alone or in combination with oral agents (metformin, thiazolidinedione, or both) were enrolled in a 30-week, randomized, double-blind, placebo-controlled clinical study to receive either BYETTA (5 mcg BID for 4 weeks then 10 mcg BID) or placebo in addition to titrated insulin glargine. In both arms, under investigator guidance, insulin was titrated to achieve a targeted fasting glucose level of <100 mg/dL using the Treat-to-Target algorithm.

- BYETTA did not increase the risk of hypoglycemia over that seen with insulin glargine alone and provided the potential benefit of weight loss (on average, 4.0 lb over 30 weeks).* Consider reducing the dose of insulin glargine in patients at increased risk for hypoglycemia.

*BYETTA is not indicated for the management of obesity, and weight change was a secondary endpoint.

**Drug interactions**

- BYETTA slows gastric emptying and can reduce the extent and rate of absorption of orally administered drugs. Use with caution with medications that have a narrow therapeutic index or require rapid gastrointestinal absorption. Medications dependent on threshold concentrations for efficacy should be taken at least 1 hour before BYETTA.

- Postmarketing reports of increased international normalized ratio (INR) sometimes associated with bleeding with concomitant use of warfarin. Monitor INR frequently until stable upon initiation or alteration of BYETTA.

**Use in specific populations**

- Based on animal data, BYETTA may cause fetal harm and should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

- Caution should be exercised when administered to a nursing woman.

- Safety and effectiveness have not been established in pediatric patients.

To learn more, visit www.ByettaHCP.com.

For additional safety profile and other important prescribing considerations, please see the adjacent pages for Brief Summary of Prescribing Information.
BYETTA® (exenatide) injection

Brief Summary: For complete details, please see full Prescribing Information.

INDICATIONS AND USAGE
Type 2 Diabetes Mellitus
BYETTA is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus.

Important Limitations of Use
BYETTA is not a substitute for insulin. BYETTA should not be used for the treatment of type 1 diabetes or diabetic ketoacidosis, as it would not be effective in these settings.

The concurrent use of BYETTA with prandial insulin has not been studied and cannot be recommended.

Based on postmarketing data, BYETTA has been associated with acute pancreatitis, including fatal and non-fatal hemorrhagic or necrotizing pancreatitis. BYETTA has not been studied in patients with a history of pancreatitis. It is unknown whether patients with a history of pancreatitis are at increased risk for pancreatitis while using BYETTA. Other antidiabetic therapies should be considered in patients with a history of pancreatitis.

DOSEAGE AND ADMINISTRATION
Recommended Dosing
Inject subcutaneously within 60 minutes prior to morning and evening meals (or before the two main meals of the day, approximately 6 hours or more apart). Initiate at 5 mcg per dose twice daily; increase to 10 mcg per dose daily after 1 month based on clinical response. Do not mix with insulin. Do not transfer BYETTA from the pen to a syringe or vial.

CONTRAINDICATIONS
Hypersensitivity
BYETTA is contraindicated in patients with prior severe hypersensitivity reactions to exenatide or to any of the product components.

WARNINGS AND PRECAUTIONS
Acute Pancreatitis
Based on postmarketing data, BYETTA has been associated with acute pancreatitis, including fatal and non-fatal hemorrhagic or necrotizing pancreatitis. After initiation of BYETTA, and after dose increases, observe patients carefully for signs and symptoms of pancreatitis (including persistent severe abdominal pain, sometimes radiating to the back, which may or may not be accompanied by vomiting). If pancreatitis is suspected, BYETTA should promptly be discontinued and appropriate management should be initiated. If pancreatitis is confirmed, BYETTA should not be restarted. Consider antidiabetic therapies other than BYETTA in patients with a history of pancreatitis.

Use with Medications Known to Cause Hypoglycemia
The risk of hypoglycemia is increased when BYETTA is used in combination with a sulfonylurea. Therefore, patients receiving BYETTA and a sulfonylurea may require a lower antidiabetic therapy.

Renal Impairment
BYETTA should not be used in patients with severe renal impairment (creatinine clearance < 30 mL/min) or end-stage renal disease and should be used with caution in patients with renal transplantation. In patients with end-stage renal disease receiving dialysis, single doses of BYETTA 5 mcg were not well-tolerated due to gastrointestinal side effects. Because BYETTA may induce nausea and vomiting with transient hypoglycemia, treatment may worsen renal function. Caution should be applied when initiating or escalating doses of BYETTA from 5 mcg to 10 mcg in patients with moderate renal impairment (creatinine clearance 30 to 50 mL/min).

Use in Pregnancy
There have been postmarketing reports of altered renal function, including increased serum creatinine, renal impairment, worsened chronic renal failure and acute renal failure, sometimes requiring hemodialysis or kidney transplantation. Some of these events occurred in patients receiving one or more pharmacologic agents known to affect renal function or hydration status, such as angiotensin converting enzyme inhibitors, nonsteroidal anti-inflammatory drugs, or diuretics. Some events occurred in patients who had been experiencing nausea, vomiting, or diarrhea, with or without dehydration. Reversibility of altered renal function has been observed in many cases with supportive treatment and discontinuation of potentially causative agents, including BYETTA.

Exenatide has not been found to be directly nephrotoxic in preclinical or clinical studies.

Gastrointestinal Disease
BYETTA has not been studied in patients with severe gastrointestinal disease, including gastroparesis. Because BYETTA is commonly associated with gastrointestinal adverse reactions, including nausea, vomiting, and diarrhea, the use of BYETTA is not recommended in patients with severe gastrointestinal disease.

Immunogenicity
Patients may develop antibodies to exenatide following treatment with BYETTA. Antibody levels were measured in 90% of subjects in the 30-week, 24-week and 16-week studies of BYETTA. In 3%, 4% and 1% of these patients, respectively, antibody formation was associated with an attenuated glycem ic control. If there is worsening glycem ic control or failure to achieve targeted glycem ic control, alternative antidiabetic therapy should be considered.

Hypersensitivity
These have been postmarketing reports of serious hypersensitivity reactions (e.g., anaphylaxis and angioedema) in patients treated with BYETTA. If a hypersensitivity reaction occurs, the patient should discontinue BYETTA and other suspect medications and promptly seek medical advice.

Macrovascular Outcomes
There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with BYETTA or any other antidiabetic drug.

ADVERSE REACTIONS
Clinical Trial Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

</table>

* A hypoglycemic episode was recorded if a patient reported symptoms of hypoglycemia with or without a blood glucose value consistent with hypoglycemia. Severe hypoglycemia was defined as an event with symptoms consistent with hypoglycemia requiring the assistance of another person and associated with either a blood glucose value consistent with hypoglycemia or prompt recovery after treatment for hypoglycemia.

† When BYETTA was initiated in combination with insulin glargine, the dose of insulin glargine was decreased by 20% in patients with an HbA1C < 8.0 % to minimize the risk of hypoglycemia. See Table 9 for insulin dose titration algorithm.

N = The number of Intent-to-Treat subjects in each treatment group.

Immunogenicity
Antibodies were assessed in 90% of subjects in the 30-week, 24-week and 16-week studies of BYETTA. In the 30-week controlled trials of BYETTA add-on to metformin and/or sulfonylurea, antibodies were assessed at 2- to 6-week intervals. The mean antibody titer peaked at week 6 and was reduced by 55% by week 30. Three hundred and sixty patients (30%) had low titer antibodies (<625) to exenatide at week 30. The level of glycermic control (HbA1C) in these patients was generally comparable to that observed in the 534 patients (50%) without antibody titers. An additional 59 patients (6%) had higher titer antibodies (>625) at 30 weeks. Of these patients, 32 (3% overall) had an attenuated glycermic response to BYETTA; the remaining 27 (3% overall) had a glycermic response comparable to that of patients without antibodies.

In the 16-week trial of BYETTA add-on to thiazolidinediones, with or without metformin, 36 patients (31%) had low titer antibodies to exenatide at 16 weeks. The level of glycermic control in this patients was generally comparable to that observed in the 89 patients (60%) without antibody titer. An additional 10 patients (9%) had higher titer antibodies at 16 weeks. Of these patients, 4 (4% overall) had an attenuated glycermic response to BYETTA; the remaining 6 (5% overall) had a glycermic response comparable to that of patients without antibodies.
in the 24-week trial of BYETTA used as monotherapy, 40 patients (26%) had low titer antibodies to exenatide at 24 weeks. The level of glycemic control in these patients was generally comparable to that observed in the 101 patients (70%) without antibody titers. An additional 3 patients (2%) had higher titer antibodies at 24 weeks. Of these patients, 1 (1% overall) had an attenuated glycemic response to BYETTA; the remaining 2 (1% overall) had a glycemic response comparable to that of patients without antibodies. Antibodies to exenatide were not assessed in the 30-week trial of BYETTA used in combination with insulin glargine.

Two hundred and ten patients with antibodies to exenatide in the BYETTA clinical trials were tested for cross-reactive antibodies to GLP-1 and/or glucagon. No treatment-emergent cross reactive antibodies were observed across the range of titer.

Other Adverse Reactions

Monotherapy

Adverse reactions (excluding hypoglycemia) for the 24-week placebo-controlled study of BYETTA BID (N = 155) when used as a monotherapy, with an incidence ≥2% and occurring more frequently in BYETTA-treated patients versus placebo-BID-treated patients (N = 77): nausea (8% vs 0%), vomiting (4% vs 0%), diarrhea (3% vs 6%), feeling jittery (8% vs 0%), increased blood pressure (0% vs 4%), headache (6% vs 3%), dyspepsia (6% vs 3%), asthenia (4% vs 2%), gastroesophageal reflux disease (3% vs 1%), and hyponatremia (3% vs 1%).

Adverse reactions reported in ≥1.0 to <2.0% of patients receiving BYETTA and reported more frequently than with placebo included decreased appetite, diarrhea, and dizziness. The most frequently reported adverse reaction associated with BYETTA, nausea, occurred in a dose-dependent fashion.

Two of the 155 patients treated with BYETTA withdrew due to adverse reactions of headache and nausea. No placebo-treated patients withdrew due to adverse reactions.

Combination Therapy

Add-on to metformin and/or sulfonylurea

Adverse reactions (excluding hypoglycemia) in the three 30-week controlled trials of BYETTA BID (N = 963) add-on to metformin and/or sulfonylurea, with an incidence ≥2% and occurring more frequently in BYETTA-treated patients versus placebo-treated patients (N = 483): nausea (44% vs 18%), vomiting (13% vs 4%), diarrhea (13% vs 6%), feeling jittery (9% vs 0%), increased blood pressure (4% vs 0%), headache (6% vs 3%), dyspepsia (6% vs 3%), asthenia (4% vs 2%), gastroesophageal reflux disease (3% vs 1%), and hyponatremia (3% vs 1%).

Adverse reactions reported in ≥1.0 to <2.0% of patients receiving BYETTA and reported more frequently than with placebo included decreased appetite. Nausea was the most frequently reported adverse reaction and occurred in a dose-dependent fashion.

With continued therapy, the frequency and severity decreased over time in most of the patients who initially experienced nausea. Patients in the long-term uncontrolled open-label extension studies at 52 weeks reported no new types of adverse reactions than those observed in the 30-week controlled trials.

The most common adverse reactions leading to withdrawal for BYETTA-treated patients were nausea (3% of patients) and vomiting (1%). For placebo-treated patients, <1% withdrew due to nausea and none due to vomiting.

Add-on to thiazolidinedione with or without metformin

Adverse reactions (excluding hypoglycemia) for the 16-week placebo-controlled study of BYETTA BID (N = 121) add-on to a thiazolidinedione, with or without metformin, with an incidence ≥2% and occurring more frequently in BYETTA-treated patients versus placebo-treated patients (N = 112): nausea (40% vs 15%), vomiting (13% vs 1%), dyspepsia (7% vs 1%), diarrhea (6% vs 3%), and gastroesophageal reflux disease (3% vs 0%).

Adverse reactions reported in ≥1.0 to <2.0% of patients receiving BYETTA and reported more frequently than with placebo included decreased appetite. Chills (n = 4) and injection-site reactions (n = 2) occurred only in BYETTA-treated patients. The two patients who reported an injection-site reaction had high titers of antibodies to exendin. Two serious adverse events (chest pain and chronic hypersensitivity pneumonitis) were reported in the BYETTA arm. No serious adverse events were reported in the placebo arm.

Add-on to thiazolidinedione, with or without metformin, and/or insulin glargine

Adverse reactions (excluding hypoglycemia) for the 30-week placebo-controlled study of BYETTA BID (N = 137) as add-on to insulin glargine with or without oral antihyperglycemic medications with an incidence ≥2% and occurring more frequently in BYETTA-treated patients versus placebo-treated patients (N = 112): nausea (40% vs 15%), vomiting (13% vs 1%), dyspepsia (7% vs 2%), asthenia (5% vs 1%), abdominal distension (4% vs 1%), decreased appetite (3% vs 0%), flatulence (2% vs 1%), gastroesophageal reflux disease (2% vs 1%).

The most frequently reported adverse reactions leading to withdrawal for BYETTA-treated patients were nausea (5.1%) and vomiting (2.9%). No placebo-treated patients withdrew due to nausea or vomiting.

Post-Marketing Experience

The following additional adverse reactions have been reported during post-approval use of BYETTA. Because these events are reported voluntarily from a population of uncertain size, it is generally not possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Allergy/Hypersensitivity: injection-site reactions, generalized pruritus and/or urticaria, macular or papular rash, angioedema, anaphylactic reaction.

Drug Interactions: international normalized ratio (INR) concomitant warfarin use sometimes associated with bleeding.

Gastrointestinal: nausea, vomiting, and/or diarrhea resulting in dehydration; abdominal distension, abdominal pain, eructation, constipation, flatulence, acute pancreatitis, hemorrhagic and necrotizing pancreatitis sometimes resulting in death.

Neurologic: dysgeusia; somnolence

Renal and Urinary Disorders: altered renal function, including increased serum creatinine, renal impairment, worsened chronic renal failure or acute renal failure (sometimes requiring hemodialysis), kidney transplant and kidney transplant dysfunction.

Skin and Subcutaneous Tissue Disorders: alopecia.
Bariatric Surgery Raises Risks of Alcoholism

➤ Patients who have gastric bypass surgery are 30 percent more likely to have problems with alcohol, according to a new prospective study.

Spurred by anecdotal reports linking bariatric surgery to an increased risk of alcohol abuse disorders, researchers led by Wendy C. King, Ph.D., of the University of Pittsburgh, designed a multicenter study to compare 1,945 patients’ experiences before and after Roux-en-Y gastric bypass (RYGB) and laparoscopic adjustable gastric banding (LAGB) surgery.

Participants completed pre- and postoperative assessments on their experience with alcohol use disorders, such as alcohol abuse and dependence. The prevalence of symptoms did not differ from the year before surgery to the first year after, but was significantly higher in the second year, going from 7.6 percent before surgery, to 7.3 percent the year after, to 9.6 percent in the second year. The increase was almost entirely among the RYGB patients, who made up 70 percent of the study group, with virtually no increase in the LAGB patients.

In an article published in JAMA [jama.jama-network.com], the researchers noted evidence that some bariatric procedures, including RYGB and sleeve gastrectomy, alter the pharmacokinetics of alcohol. These patients feel the effects of alcohol more quickly and reach a higher peak alcohol level.

The researchers identified several risk factors that increase the likelihood of alcohol problems: male sex, younger age, regular alcohol consumption, recreational drug use, and less interpersonal support. They recommend that alcohol screening and referral be offered to patients both before and after the surgery. ■

Slug’s Potential for Prostate Cancer Treatment

Continued from page 13

Like its namesake, Slug, the most recently identified member of the zinc finger transcription factor family Snail, is sticky—it binds to the androgen receptor (AR) regardless of the presence of androgen. This finding could be useful in patients with castration-resistant prostate cancer (CRPC), a deadly cancer that contains cells with altered and increased AR levels.

Led by Jer-Tsong Hsieh, Ph.D. at UT Southwestern Medical Center at Dallas, and Dalin He, M.D., at First Affiliated Hospital, Medical School of Xi’an Jiaotong University, in China, scientists stained and analyzed 400 human prostate cancer tissue specimens, categorized by hormone therapy status, Gleason score, and primary or end-stage status, to show the concurrent elevation of Slug and AR. The study also shows both Slug and AR interacting with each other, thereby forming a complex. Significantly, in the presence of Slug, AR does not need androgen to become active. Researchers backed up these observations with at least two CDNA microarrays that examined gene expression in prostate cancer tissues. In their paper, to be published soon in Molecular Endocrinology [mend.endojournals.org], the researchers report that the Slug–AR reciprocal relationship hyperactivates transcriptional activity of AR, which contributes to the progression of CRPC—that is, the androgen-independent form.

The researchers conclude that due to its key role in CRPC, Slug has potential in both prostate cancer prognosis as a marker and in therapy as a drug target. ■

Much of a woman’s health centers on her menstrual cycle. Exposure to endogenous hormones factors into both reproductive development and risk of various cancers and diseases. Menstrual cycles are typically used to measure these risks rather than the hormones directly, but how hormone concentrations and cycle length interact is largely unknown.

Assessing 259 regularly menstruating women age 18–44 years, researchers at the National Institutes of Health and the University at Buffalo found marked differences between hormone levels of long and short cycles. Follicular phase estradiol had a late rise during longer cycles, with follicle stimulating hormone (FSH) and luteinizing hormone (LH) also peaking later. LH concentrations remained high across the cycle, which may actually delay FSH and rising estradiol production and follicular development.

Women with short cycles show concentrations of FSH higher in early follicular and late luteal phases. Follicular phase estradiol was also higher. Short cycles themselves and short follicular phases specifically are conjectured to be due to early rises in FSH and faster follicular development.

An early rise of estradiol may mean per-cycle exposure is low, but a greater number of cycles experienced over a lifetime may increase exposure to levels above even regular cycles. Early follicular phase concentrations of FSH and estradiol with low luteal phase progesterone are a classic pattern of reproductive aging.

Both short and long cycles were associated with an increased risk of anovulation as compared to regular cycles. These findings, to be published in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], add strength to using cycle length in measuring anovulation risk and hormone exposure in normally cycling women.

“It’s a potentially valuable tool,” writes article author Sunni Mumford, Ph.D., “for measuring a woman’s lifetime exposure to hormones and in understanding associations with health outcomes.”

Growth Hormone Linked to Healthy Aging

If a baby continued growing at the rate she does the first year of life (about 10 inches in length), by the time she turned 60, she would be 600 inches or 50 feet tall! Luckily by 2 years of age, a baby’s height growth stabilizes at a steady rate of 2.5 inches per year until adolescence.

Growth hormone (GH) parallels this downward spiral, in that its secretion naturally declines after adolescence at a rate of 14 percent each decade. Elderly people and patients with adult onset GH deficiency have similar body compositions with reduced muscle and bone and increased fat. The converse is also true—increased adiposity reduces GH secretion. These findings have led researchers to believe that impaired GH may contribute to the development of metabolic maladies such as obesity.

Seeking to find out what happens to GH secretion in young adults with dietary-induced weight gain, Lili Huang, M.D., Frederick J. Steyn, Ph.D., and a team of scientists led by Chen Chen, M.D., Ph.D., at the School of Biomedical Sciences, University of Queensland in Brisbane, Australia, fed wild-type mice either a standard or high-fat diet until the mice reached early adulthood (~11 weeks). Blood sample analysis revealed lower serum GH levels between ages 12 and 16 weeks in the high-fat-fed mice compared to those on regular chow. In their paper, to be published soon in Endocrinology [endo.journals.org], the researchers report increased adiposity in high-fat diet mice, with adipose tissue also found in the liver, and decreased levels of insulin-like growth factor I (IGF-I), which works in concert with GH to maintain healthy aging and phenotype. IGF-I attrition is also characteristic of obesity.

The researchers conclude that weight gain speeds up GH secretion decline, which may yield gigantic health problems throughout the lifespan, including increased risk for hyperinsulinemia, obesity, and impaired liver function.

Irregular Menstrual Cycles as Markers for Health Risks

Much of a woman’s health centers on her menstrual cycle. Exposure to endogenous hormones factors into both reproductive development and risk of various cancers and diseases. Menstrual cycles are typically used to measure these risks rather than the hormones directly, but how hormone concentrations and cycle length interact is largely unknown.

Assessing 259 regularly menstruating women age 18–44 years, researchers at the National Institutes of Health and the University at Buffalo found marked differences between hormone levels of long and short cycles. Follicular phase estradiol had a late rise during longer cycles, with follicle stimulating hormone (FSH) and luteinizing hormone (LH) also peaking later. LH concentrations remained high across the cycle, which may actually delay FSH and rising estradiol production and follicular development.

Women with short cycles show concentrations of FSH higher in early follicular and late luteal phases. Follicular phase estradiol was also higher. Short cycles themselves and short follicular phases specifically are conjectured to be due to early rises in FSH and faster follicular development.

An early rise of estradiol may mean per-cycle exposure is low, but a greater number of cycles experienced over a lifetime may increase exposure to levels above even regular cycles. Early follicular phase concentrations of FSH and estradiol with low luteal phase progesterone are a classic pattern of reproductive aging.

Both short and long cycles were associated with an increased risk of anovulation as compared to regular cycles. These findings, to be published in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], add strength to using cycle length in measuring anovulation risk and hormone exposure in normally cycling women.

“It’s a potentially valuable tool,” writes article author Sunni Mumford, Ph.D., “for measuring a woman’s lifetime exposure to hormones and in understanding associations with health outcomes.”

Dan Kelly
Fibroblast growth factor 21 (FGF21), a novel hormone involved in glucose and energy homeostasis, shows promise in treating obesity and diabetes. In rodents and primates, it has been shown to normalize blood sugar and lipid levels and decrease weight. The only catch is its short life. FGF21 stays in the body for only one to two hours. To get the desired effects, researchers would have to give multiple injections, thus failing to avoid the same complication that most insulin users already face.

In hopes of developing a longer-acting alternative, researchers, led by Jing Xu, Ph.D. and Murielle M. Véniart, Ph.D., of Amgen, Inc., in Thousand Oaks, California, fused the hormone containing two engineered mutations with an Fc fragment to generate a molecule they called Fc-FGF21(RG). They then compared the efficacy of their new creation with that of hrFGF21 in diet-induced obese mice and obese rhesus monkeys.

The diet-induced obese mice treated with either compound showed several metabolic improvements: decreased body weight; decreased glucose, insulin, cholesterol, and triglyceride levels; and improved glucose tolerance. The obese rhesus monkeys showed similar results in these measures, with the Fc-FGF21(RG) having greater effects than the hrFGF21. An important difference: Both species were treated with the Fc-FGF21(RG) only once every five to seven days, compared with daily administration of hrFGF21.

In an article awaiting publication in Endocrinology [endo.endojournals.org], the researchers report that in this longitudinal study, the threshold for normal calcium absorption occurred at a very low level of serum 25OHD, less than 5–10 ng/mL (12.5–25 nmol/L)—this being the 25OHD level at which serum 1,25(OH)2D fell—much lower than previously reported.

The researchers conclude that vitamin D supplementation may not be useful in older women unless they have severe vitamin D deficiency (< 5–10 ng/mL). This population can achieve the desired level of calcium absorption by drinking an extra 100 ml of milk or with a 100-mg calcium supplement, they add.

Eric Seaborg

Vitamin D Dietary Supplements No Help in Normal Calcium Absorption

▶ Calcitriol, the vitamin D active metabolite, is known to mediate calcium absorption in the gut. It is dependent on an adequate substrate of serum 25OHD. Also well documented is the age-related decline in the efficiency of this mechanism and a concomitant decrease in endogenous calcitriol production. Due to the high incidence of calcium deficiency-related disorders such as osteoporosis among older adult women, health care providers have long advised dietary supplements of calcium plus vitamin D in this population. A recent cross-sectional study postulated that there was a threshold of serum 25OHD of 30 ng/mL (75 nmol/L) at which point increasing supplemental vitamin D became more effective for increasing calcium absorption.

Scientists led by Chris Gallagher, M.D., at the Creighton University Medical Center in Omaha, Nebraska, tested where this threshold lies by analyzing data from the ViDOS (Vitamin D supplementation in Older Subjects) trial, in which 143 postmenopausal women were given dietary supplements of 200 mg calcium plus one of seven levels of vitamin D supplement ranging from 400–4,800 IU or placebo daily for one year to measure calcium absorption across a range of resulting serum 25OHD levels, from 10 to 66 ng/mL (25–165 nmol/L).

In their paper, to be published soon in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org], the researchers report that in this longitudinal study, the threshold for normal calcium absorption occurred at a very low level of serum 25OHD, less than 5–10 ng/mL (12.5–25 nmol/L)—this being the 25OHD level at which serum 1,25(OH)2D fell—much lower than previously reported.

The researchers conclude that vitamin D supplementation may not be useful in older women unless they have severe vitamin D deficiency (< 5–10 ng/mL). This population can achieve the desired level of calcium absorption by drinking an extra 100 ml of milk or with a 100-mg calcium supplement, they add.

Building a Better Diabetes Drug

▶ Fibroblast growth factor 21 (FGF21), a novel hormone involved in glucose and energy homeostasis, shows promise in treating obesity and diabetes. In rodents and primates, it has been shown to normalize blood sugar and lipid levels and decrease weight. The only catch is its short life. FGF21 stays in the body for only one to two hours. To get the desired effects, researchers would have to give multiple injections, thus failing to avoid the same complication that most insulin users already face.

In hopes of developing a longer-acting alternative, researchers, led by Jing Xu, Ph.D. and Murielle M. Véniart, Ph.D., of Amgen, Inc., in Thousand Oaks, California, fused the hormone containing two engineered mutations with an Fc fragment to generate a molecule they called Fc-FGF21(RG). They then compared the efficacy of their new creation with that of hrFGF21 in diet-induced obese mice and obese rhesus monkeys.

The diet-induced obese mice treated with either compound showed several metabolic improvements: decreased body weight; decreased glucose, insulin, cholesterol, and triglyceride levels; and improved glucose tolerance. The obese rhesus monkeys showed similar results in these measures, with the Fc-FGF21(RG) having greater effects than the hrFGF21. An important difference: Both species were treated with the Fc-FGF21(RG) only once every five to seven days, compared with daily administration of hrFGF21.

In an article awaiting publication in Endocrinology [endo.endojournals.org], the researchers note that finding in two species that weekly Fc-FGF21(RG) showed efficacy similar to or greater than daily hrFGF21 offers a promising avenue to explore for new therapeutic options.

Eric Seaborg
Fructose Transporter Becomes Latest Obesity Drug Target

One factor in the increased obesity epidemic is the overindulgence in dietary sugars such as high-fructose corn syrup (HFCS). Researchers are honing in on how fructose is involved in fat cell formation. Data from the U.S. National Health and Nutrition Examination Survey (NHANES) suggest that about 15 percent of Americans consume greater than 25 percent of their energy from added sugars such as HFCS. Research in rhesus monkeys has shown that when these animals are fed about 30 percent of their energy intake as fructose, they develop features of metabolic syndrome such as abdominal obesity, dyslipidemia, and inflammation.

To gain greater insight into how fructose promotes fat, Anthony Heaney, M.D., and his research group from the University of California, Los Angeles, examined a mouse pre-adipocyte cell line, 3T3-L1 and mice that lacked a glucose/fructose transporter, GluT5. Their results are discussed in an upcoming issue of Molecular Endocrinology [mend.endojournals.org].

Gonadotropins Not Linked to Higher IVF Failures

Although it has become a popular option for women seeking treatment for infertility, the rates of in vitro fertilization (IVF) resulting in a viable pregnancy still remain low, mostly due to the high numbers of embryos produced with chromosomal abnormalities.

Researchers from the University of Valencia in Spain, led by Elena Labarta, M.D., explored whether the high chromosomal abnormality rates, as compared with the rates in embryos produced from natural fertilization, could be traced to the use of gonadotropins to stimulate the ovaries during IVF.

The study took place in a private infertility clinic over a four-year period. Researchers recruited healthy, fertile oocyte and sperm donors between the ages of 18 and 34. An unstimulated IVF cycle was first conducted on 51 oocyte donors, which resulted in 35.3 percent of the embryos having chromosomal abnormalities. Of those 51 women, 46 later completed a second stimulated cycle—taking about 10 days of a combination dose of 150 IU follicle-stimulating hormone and 75 IU of highly purified human menopausal gonadotropin. The same sperm donor was used for both cycles.

In the women who completed both cycles, 34.8 percent of the embryos showed chromosomal abnormalities in the unstimulated cycle compared with 40.6 percent in the stimulated cycle. The study found no differences between the unstimulated and stimulated cycles in embryo quality and type of chromosomal abnormalities.

The researchers conclude in their upcoming article in The Journal of Clinical Endocrinology & Metabolism [jcem.endojournals.org] that the use of moderate doses of gonadotropins for ovarian stimulation during an IVF cycle does not significantly increase the abnormality rate in young women with normal ovulation. ■

Jacqueline Ruttimann

Preadipocytes that were incubated in fructose had a greater propensity toward differentiation into full-fledged fat cells than those on regular cell culture medium. When these cells were hit with a specific GluT5 inhibitor, differentiation decreased. Similarly, GluT5-/- mice had less white adipose tissue compared with wild-type mice and were resistant to diet-induced obesity.

These findings suggest a new target for weight loss drugs, suggested the authors. ■

Glenda Fauntleroy
Sex reigns king over all taboo topics. Parents dread the infamous birds and bees conversation almost as much as their children do. Although sex education remains an awkward but important step for adolescents, recent studies indicate that an important demographic is due for a refresher course: grandparents. The risk of sexually transmitted diseases (STDs) in seniors is growing faster than in teens. Younger groups are still at a much greater overall risk of infection, but the U.S. Centers for Disease Control and Prevention (CDC) has reported skyrocketing rates of STDs in people more than 50 years of age during the past decade. Cases of syphilis and chlamydia alone have nearly tripled. People often assume that sexual activity ceases after a certain age, when sex hormones and vitality begin to diminish. The truth is quite the opposite. The elderly may not talk much about sex, but that does not mean they are not engaging in it. More than 80 percent of people 50 years and older reported regular sexual activity in one British study, which included participants up to 90 years of age. A comparable study in the United States found 73 percent of those ages 57–64 years, 53 percent of those ages 65–74 years, and 26 percent of those ages 75–85 years to be sexually active. Sex can be good for general health if practiced safely. Unfortunately, seniors are less likely to use protection.

A 2009 AARP survey found that only 12 percent of single and dating men and 32 percent of single and dating women 45 years of age and older consistently used protection during sex. As a result, research from the British journal *Sexually Transmitted Infections* indicates that STD rates among those in this age group have doubled in one decade. Without fear of pregnancy, some seniors forgo condoms during sex. One theory is that older populations are hesitant to discuss sex and assume that STDs rarely occur in their age group. The hard truth is that 17 percent of all new HIV diagnoses and 23 percent of all new AIDS diagnoses in the United States in 2009 were in patients 50 years and older, according to the CDC.

**The Benefits of Oxytocin**

Studies show that human contact is good for all of us, seniors included. The hormone oxytocin, which is released during orgasm in men and women, plays a role in social bonding and our overall sense of well-being. Elders who live relatively isolated lives often lack opportunities for intimacy, which can promote mental and physical health. It is not unusual for people living in senior communities or nursing homes to turn to their peers for physical contact, even if suffering from a degenerative mental condition like dementia. A recent Australian study published in the *Journal of Medical Ethics* showed that patients still pursue sexual relationships during the earlier stages of such illnesses. The study also discusses claims that some health care workers in institutions prohibited sex among patients based on the staff’s personal beliefs or safety concerns for patients. The question of when sex should be allowed or denied in nursing homes falls into a gray area that has not received much attention. Some nursing homes work to combat the touch deficit by bringing in pets for patients. The therapeutic effects of petting and cuddling with animals have been shown...
to increase oxytocin levels among older people who may be deficient in the hormone.

Although the benefits of touch and sexual activity are clearly documented, providing comprehensive information to sexually active seniors has its challenges. Society’s youth-oriented culture often results in a negative portrayal of physical intimacy among old people, which can make some of them less forthcoming about sexual problems. Diagnosing sexually transmitted diseases and infections in seniors can be difficult due to the confusing of aging and disease symptoms. Patients may chalk up frequent urination and other mild aches and pains as a natural progression into the golden years. By the time an STD is caught and treated, it might have already spread to other sexual partners.

Physical effects of aging also catalyze the spread of diseases during sex. Vaginal atrophy, a thinning of vaginal membranes after menopause and a decline in estrogen, puts women at risk for tearing during sex and for transmission of sexual diseases. “There is an argument that changes to the vaginal mucosa postmenopause may make the tissues more friable and create microabrasions, which enhance transmission of sexually transmitted infections,” said Rachel Von Simson, a final year medical student at the King’s College in London and co-author of a recent editorial called “Sexual Health and the Older Adult” in the Student BMJ. “Vaginal pH is higher postmenopause, and in younger adults a higher vaginal pH has been associated with an increased risk of STDs.”

Research has not definitely explained why STD rates are increasing among older women, however, even though a higher pH has always been the norm among them, nor can it explain why the rates are increasing in older men. Erectile dysfunction (ED) drugs like Viagra provide one of the connections. A study published in the Annals of Medicine tested the hypothesis that older men using ED drugs were more likely to contract STDs than those who did not request these drugs from their physician. By reviewing thousands of insurance claims, Anupam B. Jena, M.D., Ph.D., an assistant professor of health care policy at Harvard Medical School and a physician at Massachusetts General Hospital, found that men more than 40 years of age using ED drugs were 2–3 times more likely to contract an STD than other men in the same age group. Although taking ED medications cannot be said to directly increase a patients’ risk of infection, Jena said, “the introduction of these medications allowed them to either have sex or to have sex more frequently, and by definition having sex more often one would expect that STD rates would go up.”

Safe Sex Campaigns

Longer lives and higher divorce rates have also been pinpointed as factors in the spread of STDs among older adults. With good health lasting longer into life, people are more likely to remain sexually active after retirement. This factor, combined with an uptick in divorces, many later in life, increases the likelihood of having a greater number of sexual partners over a lifetime. Von Simson explained that the STD trend has led to the inclusion of elders in the National Survey of Sexual Health and Behavior, started by Dr. Alfred Kinsey in the 1940s. A similar report, “NATSAL [National Survey of Sexual Attitudes and Lifestyles], is expanding to include older adults, but this will only give us a snapshot of now, not of how behaviors may have changed,” Von Simson said. The lack of historical evidence on the sexual behavior of seniors presents a challenge for researchers seeking the source of increasing STD infections. She believes that many opportunities remain for research in this field.

Because contracting STDs is still far more common among young adults, the primary focus of the medical community has
been on the adolescent cohort. But the changing tides of sex-related issues in elders has inspired a new wave of safe sex campaigns and seminars in several cities, from New York to San Jose. In May 2012, SaferSex4Seniors.org released a risqué public service announcement in the form of a YouTube video. The 30-second video shows fully-clothed seniors demonstrating various sexual positions in rapid succession. The clip ends with the statistic that STD rates among seniors in Florida have risen 71 percent. The tagline encourages seniors to “Do it. Safely.”

Advising Older Patients

Experts agree that rising STD rates do not mean seniors should be pressed into abstinence. A study presented at The Endocrine Society’s 94th Annual Meeting, ENDO 2012, in Houston, Texas, found that testosterone levels remain high in healthy sexually active men between the ages of 35 and 80 years, especially in those who are married. Healthy levels of this hormone promote important bodily functions and help keep muscle-to-fat ratios in check. Physical intimacy and touch set off a complex chain of hormonal responses that have been shown to enhance quality of life at any age. When it comes to sex, a number of studies show that overall health is much more critical that one’s calendar age. From a scientific point of view it is perfectly fine for seniors to “do it.”

The conclusive cause of increasing STD rates in older populations many continue to elude researchers for a while. The answer may be too complex and multifaceted to pinpoint cause, but Jena suspects the trend is simply linked to a change in social norms. “It’s not like there were massive advertising campaigns or things like Facebook that only applied to older folks,” Jena said. Experts say doctors should be prepared to advise their older patients about how to carry on a healthy sex life even as they age, and to remind them of the basic safety tip they learned years ago in high school: Always use a condom.

INDICATIONS AND USAGE

- FORTEO® (teriparatide [rDNA origin] injection) is indicated for the treatment of postmenopausal women with osteoporosis at high risk for fracture, to increase bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture, and for the treatment of men and women with osteoporosis associated with sustained, systemic glucocorticoid therapy (daily dosage equivalent to 5 mg or greater of prednisone) at high risk for fracture.

- High risk for fracture is defined as a history of osteoporotic fracture, multiple risk factors for fracture, or patients who have failed or are intolerant to other available osteoporosis therapy.

FORTEO is administered as a 20 microgram once daily dose and is available in a 2.4 mL prefilled delivery device for subcutaneous injection over 28 days.

WARNING: POTENTIAL RISK OF OSTEOSARCOMA

See the Important Safety Information for Complete Boxed Warning.

- In rats, teriparatide caused an increase in the incidence of osteosarcoma, a malignant bone tumor.

- Because of the uncertain relevance of the rat osteosarcoma finding to humans, prescribe FORTEO only for patients for whom potential benefits outweigh potential risk.

- FORTEO should not be prescribed for patients at increased baseline risk for osteosarcoma (e.g., those with Paget’s disease of bone or unexplained elevations of alkaline phosphatase, pediatric and young adult patients with open epiphyses, or prior external beam or implant radiation therapy involving the skeleton).

Find out how FORTEO helps form new bone at www.FORTEOhcp.com
NOW IS THE TIME FOR ANABOLIC ACTION

FORTEO CONNECT OFFERS PERSONALIZED SUPPORT TO HELP PATIENTS THROUGHOUT THEIR TREATMENT

- Patients can choose to sign up for an insurance investigation, injection training, and/or ongoing support for up to 24 months
- Now with the FORTEO Co-pay Card, eligible commercially insured patients will pay no more than a $50/month co-pay*

*This offer may be terminated, rescinded, revoked, or amended by Lilly USA, LLC at any time without notice. Patient should provide the card to his/her pharmacist, along with a valid prescription from the physician.

FORTEO SELECT SAFETY INFORMATION

Prescribe FORTEO only for patients for whom the potential benefits are considered to outweigh the potential risks. FORTEO should not be prescribed for patients at increased baseline risk for osteosarcoma, including those with Paget’s disease of bone, unexplained elevations of alkaline phosphatase, pediatric and young adult patients with open epiphyses, or prior external beam or implant radiation therapy. Additionally, patients with bone metastases or a history of skeletal malignancies, metabolic bone diseases other than osteoporosis, or pre-existing hypercalcemia should not receive FORTEO.

Use of FORTEO for more than 2 years during a patient’s lifetime is not recommended.

Please see Important Safety Information, including Boxed Warning regarding osteosarcoma, and Brief Summary on following pages. See Full User Manual that accompanies the delivery device.
INDICATIONS AND USAGE

• FORTEO® (teriparatide [rDNA origin] injection) is indicated for the treatment of postmenopausal women with osteoporosis at high risk for fracture, to increase bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture, and for the treatment of men and women with osteoporosis associated with sustained, systemic glucocorticoid therapy (daily dosage equivalent to 5 mg or greater of prednisone) at high risk for fracture.

• High risk for fracture is defined as a history of osteoporotic fracture, multiple risk factors for fracture, or patients who have failed or are intolerant to other available osteoporosis therapy.

FORTEO is administered as a 20 microgram once daily dose and is available in a 2.4 mL prefilled delivery device for subcutaneous injection over 28 days.

IMPORTANT SAFETY INFORMATION

WARNING: POTENTIAL RISK OF OSTEOSARCOMA

In male and female rats, teriparatide caused an increase in the incidence of osteosarcoma (a malignant bone tumor) that was dependent on dose and treatment duration. The effect was observed at systemic exposures to teriparatide ranging from 3 to 60 times the exposure in humans given a 20-mcg dose. Because of the uncertain relevance of the rat osteosarcoma finding to humans, prescribe FORTEO® (teriparatide [rDNA origin] injection) only for patients for whom the potential benefits are considered to outweigh the potential risk. FORTEO should not be prescribed for patients who are at increased baseline risk for osteosarcoma (including those with Paget’s disease of bone or unexplained high risk for fracture, to increase bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture, and for the treatment of men and women with osteoporosis associated with sustained, systemic glucocorticoid therapy (daily dosage equivalent to 5 mg or greater of prednisone) at high risk for fracture).

CONTRAINDICATIONS

Hypersensitivity to teriparatide or to any of its excipients. Reactions have included angioedema and anaphylaxis.

WARNINGS AND PRECAUTIONS

The following categories of patients have increased baseline risk of osteosarcoma and therefore should not be treated with FORTEO: Paget’s disease of bone, pediatric populations and young adults with open epiphyses, or prior external beam or implant radiation therapy.

Patients should be encouraged to enroll in the voluntary FORTEO Patient Registry, which is designed to collect information about any potential risk of osteosarcoma in patients who have taken FORTEO. Enrollment information can be obtained by calling 1-866-382-6813, or by visiting www.forteoregistry.ri.org.

Osteosarcoma occurs in about 4 out of every million older adults each year. Cases of bone tumor and osteosarcoma have been reported rarely in people taking FORTEO in the past marketing period. The causality to FORTEO use is unclear.

Use of FORTEO for more than 2 years during a patient’s lifetime is not recommended.

Patients with the following conditions also should not receive FORTEO: bone metastases or a history of skeletal malignancies, metabolic bone diseases other than osteoporosis, or hypercalcemic disorders.

FORTEO may increase serum calcium, urinary calcium, and serum uric acid.

Use with caution in patients with active or recent urolithiasis because of risk of exacerbation. If active urolithiasis or pre-existing hypercalciuria are suspected, measurement of urinary calcium excretion should be considered.

Transient orthostatic hypotension may occur with initial doses of FORTEO. In short-term clinical pharmacology studies, transient episodes of symptomatic orthostatic hypotension were observed in 5% of patients. FORTEO should be administered initially under circumstances where the patient can sit or lie down if symptoms of orthostatic hypotension occur.

Patients receiving digoxin should use FORTEO with caution because FORTEO may transiently increase serum calcium and hypercalcemia may predispose patients to digitis toxicity.

ADVERSE REACTIONS

The most common adverse reactions in clinical trials include: arthralgia (10.1 FORTEO vs. 8.4 placebo), pain (21.3 FORTEO vs. 20.5 placebo), and nausea (8.5 FORTEO vs. 6.7 placebo). Other adverse reactions include: dizziness, leg cramps, joint aches, and injection site reactions.

USE IN PREGNANCY/NURSING MOTHERS

FORTEO should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Based on animal studies, FORTEO may cause fetal harm.

It is not known whether teriparatide is excreted in human milk. Breastfeeding mothers should discontinue nursing or FORTEO, taking into account the importance of treatment to the mother.

INSTRUCTIONS FOR FORTEO USE

FORTEO is provided as a fixed-dose, prefilled delivery device that can be used for up to 28 days, including the first injection. The delivery device contains 28 daily doses of 20 mcg each. Do not transfer the contents of the delivery device into a syringe. The FORTEO Delivery Device should be stored under refrigeration at 36°F to 46°F (2°C to 8°C) at all times. Do not use FORTEO if it has been frozen.

For more safety information, please see Brief Summary of Prescribing Information, including Boxed Warning regarding osteosarcoma, on following pages. See Full User Manual that accompanies the delivery device.
FORTEO® (teriparatide [rDNA origin] 20 mcg for injection)

Brief Summary Consult the package insert for complete prescribing information.

**WARNING: POTENTIAL RISK OF OSTEOSARCOMA**

In male and female rats, teriparatide caused an increase in the incidence of osteosarcoma (a malignant bone tumor) that was dependent on dose and treatment duration. The effect was observed at systemic exposures to teriparatide ranging from 3 to 60 times the exposure in humans given a 20-mcg dose. Because of the uncertain relevance of the rat osteosarcoma finding to humans, prescribe FORTEO® only for patients for whom the potential benefits are considered to outweigh the potential risk. FORTEO should not be prescribed for patients who are at increased baseline risk for osteosarcoma (including those with Paget's disease of bone or unexplained elevations of alkaline phosphatase, pediatric and young adult patients with open epiphyses, or prior external beam or implant radiation therapy involving the skeleton).

**INDICATIONS AND USAGE**

FORTEO is indicated: for the treatment of postmenopausal women with osteoporosis at high risk for fracture; to increase bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture; for the treatment of men and women with osteoporosis associated with sustained, systemic glucocorticoid therapy at high risk for fracture. High risk for fracture is defined as a history of osteoporotic fracture, multiple risk factors for fracture, or patients who have failed or are intolerant to other available osteoporosis therapy.

**CONTRAINDICATIONS**

Do not use FORTEO in patients with Hypersensitivity to teriparatide or to any of its excipients. Reactions have included angioedema and anaphylaxis.

**WARNINGS AND PRECAUTIONS**

**Osteosarcoma** In male and female rats, teriparatide caused an increase in the incidence of osteosarcoma (a malignant bone tumor) that was dependent on dose and treatment duration. FORTEO should not be prescribed for patients at increased baseline risk of osteosarcoma. These include Paget's disease of bone (unexplained elevations of alkaline phosphatase may indicate Paget's disease of bone); pediatric and young adult patients with open epiphyses; prior external beam or implant radiation therapy involving the skeleton. Patients should be encouraged to enroll in the voluntary FORTEO Patient Registry, which is designed to collect information about any potential risk of osteosarcoma in patients who have taken FORTEO. Enrollment information can be obtained by calling 1-866-382-6813, or by visiting www.forteoregistry.rti.org.

**Treatment Duration**

The safety and efficacy of FORTEO have not been evaluated beyond 2 years of treatment. Consequently, use of the drug for more than 2 years during a patient's lifetime is not recommended. **Bone Metastases and Skeletal Malignancies** Patients with bone metastases or a history of skeletal malignancies should not be treated with FORTEO. **Metabolic Bone Diseases** Patients with metabolic bone diseases other than osteoporosis should not be treated with FORTEO. **Hypercalcemia and Hypercalcemic Disorders** FORTEO has not been studied in patients with pre-existing hypercalcemia. These patients should not be treated with FORTEO because of the possibility of exacerbating hypercalcemia. Patients known to have an underlying hypercalcemic disorder, such as primary hyperparathyroidism, should not be treated with FORTEO. **Urolithiasis or Pre-existing Hypercalcuria** In clinical trials, the frequency of urolithiasis was similar in patients treated with FORTEO and placebo. However, FORTEO has not been studied in patients with active urolithiasis. If active urolithiasis or pre-existing hypercalcuria are suspected, measurement of urinary calcium excretion should be considered. FORTEO should be used with caution in patients with active or recent urolithiasis because of the potential to exacerbate this condition. **Orthostatic Hypotension** FORTEO should be administered initially under circumstances in which the patient can sit or lie down if symptoms of orthostatic hypotension occur. In short-term clinical pharmacology studies with teriparatide, transient episodes of symptomatic orthostatic hypotension were observed in 5% of patients. Typically, an event began within 4 hours of dosing and spontaneously resolved within a few minutes to a few hours. When transient orthostatic hypotension occurred, it happened within the first several doses, it was relieved by placing the person in a reclining position, and it did not preclude continued treatment. **Drug Interactions** Hypercalcemia may predispose patients to digitalis toxicity. Because FORTEO transiently increases serum calcium, patients receiving digoxin should use FORTEO with caution.

**ADVERSE REACTIONS**

**Clinical Trials Experience** Because clinical studies are conducted under widely varying conditions, adverse reaction rates observed in the clinical studies of a drug cannot be directly compared to rates in the clinical studies of another drug and may not reflect the rates observed in practice. **Treatment of Osteoporosis in Men and Postmenopausal Women** The safety of FORTEO in the treatment of osteoporosis in men and postmenopausal women was assessed in two randomized, double-blind, placebo-controlled trials of 1382 patients (21% men, 79% women) aged 28 to 86 years (mean 67 years). The median durations of the trials were 11 months for men and 19 months for women, with 691 patients exposed to FORTEO and 691 patients to placebo. All patients received 1000 mg of calcium plus at least 400 IU of vitamin D supplementation per day. The incidence of all cause mortality was 1% in the FORTEO group and 1% in the placebo group. The incidence of serious adverse events was 16% in FORTEO patients and 19% in placebo patients. Early discontinuation due to adverse events occurred in 7% of FORTEO patients and 6% of placebo patients. **Percentage of Patients with Adverse Events Reported by at least 2% of FORTEO-Treated Patients and in More FORTEO-Treated Patients than Placebo-Treated Patients from the Two Principal Osteoporosis Trials in Women and Men Adverse Events Are Shown Without Attribution of Causality**

**Laboratory Studies**

**Serum Calcium** FORTEO transiently increased serum calcium, with the maximal effect observed at approximately 4 to 6 hours post-dose. Serum calcium measured at least 16 hours post-dose was not different from pretreatment levels. In clinical trials, the frequency of at least 1 episode of transient hypercalcemia in the 4 to 6 hours after FORTEO administration was increased from 2% of women and none of the men treated with placebo to 11% of women and 6% of men treated with FORTEO. The number of patients treated with FORTEO who transient hypercalcemia was verified on consecutive measurements was 3% of women and 1% of men. **Urinary Calcium** FORTEO increased urinary calcium excretion, but the frequency of hypercalcuria in clinical trials was similar for patients treated with FORTEO and placebo. **Serum Uric Acid** FORTEO increased serum uric acid concentrations. In clinical trials, 3% of FORTEO patients had serum uric acid concentrations above the upper limit of normal compared with 1% of placebo patients. However, the hyperuricemia did not result in an increase in gout, arthralgia, or urolithiasis. **Renal Function** No clinically important adverse renal effects were observed in clinical studies. Assessments included creatinine clearance; measurements of blood urea nitrogen (BUN), creatinine, and electrolytes in serum; urine specific gravity and pH; and examination of urine sediment. **Studies in Men and Women with Glucocorticoid-Induced Osteoporosis** The safety of FORTEO in the treatment of men and women with glucocorticoid-induced osteoporosis was assessed in a randomized, double-blind, active-controlled trial of 428 patients (19% men, 81% women) aged 22 to 89 years (mean 57 years) treated with >5 mg per day prednisone or equivalent for a minimum of 3 months. The duration of the trial was 18 months with 214 patients exposed to FORTEO and 214 patients exposed to oral daily bisphosphonate (active control). All patients received 1000 mg of calcium plus 800 IU of vitamin D supplementation per day. The incidence of all cause mortality was 4% in the FORTEO group and 6% in the active...
control group. The incidence of serious adverse events was 21% in FORTEO patients and 18% in active control patients, and included pneumonia (3% FORTEO, 1% active control). Early discontinuation because of adverse events occurred in 15% of FORTEO patients and 12% of active control patients, and included dizziness (2% FORTEO, 0% active control). Adverse events reported at a higher incidence in the FORTEO group and with at least a 2% difference in FORTEO-treated patients compared with active control-treated patients were: nausea (14%, 7%), gastritis (7%, 3%), pneumonia (6%, 3%), dyspnea (6%, 3%), insomnia (5%, 1%), anxiety (4%, 1%), and herpes zoster (3%, 1%), respectively. Postmarketing Experience: The following adverse reactions have been identified during postmarketing use of FORTEO. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Osteosarcoma: Cases of bone tumor and osteosarcoma have been reported rarely in the postmarketing period. The causality to FORTEO use is unclear. Long term osteosarcoma surveillance studies are ongoing. Hypercalcemia: Hypercalcemia greater than 13.0 mg/dL has been reported with FORTEO use. Adverse events reported since market introduction that were temporally (but not necessarily causally) related to FORTEO therapy include the following: Allergic Reactions: Anaphylactic reactions, drug hypersensitivity, angioedema, urticaria; Investigations: Hyperuricemia; Respiratory System: Acute dyspnea, chest pain; Musculoskeletal: Muscle spasms of the leg or back; Other: Injection site reactions including injection site pain, swelling and bruising; oro-facial edema.

USE IN SPECIFIC POPULATIONS

Pregnancy Category C. There are no adequate and well-controlled studies of FORTEO in pregnant women. In animal studies, teriparatide increased skeletal deviations and variations in mouse offspring at more than 60 times the equivalent human dose and produced mild growth retardation and reduced motor activity in rat offspring at doses more than 120 times the equivalent human dose. FORTEO should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. In animal studies, pregnant mice received teriparatide during organogenesis at subcutaneous doses 8 to 267 times the human dose. At doses ≥ 60 times the human dose, the fetuses showed an increased incidence of skeletal deviations or variations (interrupted rib, extra vertebra or rib). When pregnant rats received subcutaneous teriparatide during organogenesis at doses 16 to 540 times the human dose, the fetuses showed no abnormal findings. In a perinatal/postnatal study, pregnant rats received subcutaneous teriparatide from organogenesis at subcutaneous doses 8 to 60 times the human dose. At doses ≥ 60 times the human dose, the fetuses showed no abnormal findings. For the fetus. In animal studies, teriparatide increased skeletal deviations and variations in mouse offspring at more than 60 times the equivalent human dose and produced mild growth retardation and reduced motor activity in rat offspring at doses more than 120 times the equivalent human dose. FORTEO should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. In animal studies, pregnant mice received teriparatide during organogenesis at subcutaneous doses 8 to 267 times the human dose. At doses ≥ 60 times the human dose, the fetuses showed an increased incidence of skeletal deviations or variations (interrupted rib, extra vertebra or rib). When pregnant rats received subcutaneous teriparatide during organogenesis at doses 16 to 540 times the human dose, the fetuses showed no abnormal findings. In a perinatal/postnatal study, pregnant rats received subcutaneous teriparatide from organogenesis at subcutaneous doses 8 to 60 times the human dose. At doses ≥ 60 times the human dose, the fetuses showed no abnormal findings. Exposures multiples were normalized based on body surface area (mg/m2). Actual animal doses: mice (30 to 1000 mcg/kg/day); rats (30 to 1000 mcg/kg/day). Nursing Mothers: It is not known whether teriparatide is excreted in human milk. Because of the potential for tumorigenicity shown for teriparatide in animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. Pediatric Use: The safety and efficacy of FORTEO have not been established in any pediatric population. FORTEO should not be prescribed in patients at an increased baseline risk of osteosarcoma which include pediatric and young adult patients with open epiphyses. Therefore, FORTEO is not indicated for use in pediatric or young adult patients with open epiphyses. Geriatric Use: Of the patients receiving FORTEO in the osteoporosis trial of 1837 postmenopausal women, 75% were 65 years of age and over and 23% were 75 years of age and over. Of the patients receiving FORTEO in the osteoporosis trial of 437 men, 39% were 65 years of age and over and 13% were 75 years of age and over. No overall differences in safety or effectiveness were observed between these subjects and younger subjects, and other reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out. Hepatic Impairment: No studies have been performed in patients with hepatic impairment. Renal Impairment: In 5 patients with severe renal impairment (CrCl<30 mL/min), the AUC and T1/2 of teriparatide were increased by 73% and 77%, respectively. Maximum serum concentration of teriparatide was not increased.

OVERDOSAGE

Incidents of overdose in humans have not been reported in clinical trials. Teriparatide has been administered in single doses of up to 100 mcg and in repeated doses of up to 60 mcg/day for 6 weeks. The effects of overdose that might be expected include a delayed hypercalcemic effect and risk of orthostatic hypotension. Nausea, vomiting, dizziness, and headache might also occur. In postmarketing spontaneous reports, there have been cases of medication errors in which the entire contents (up to 800 mcg) of the FORTEO delivery device (pen) have been administered as a single dose. Transient events reported have included nausea, weakness/lethargy and hypotension. In some cases, no adverse events occurred as a result of the overdose. No fatalities associated with overdose have been reported. Overdose Management There is no specific antidote for teriparatide. Treatment of suspected overdose should include discontinuation of FORTEO, monitoring of serum calcium and phosphorus, and implementation of appropriate supportive measures, such as hydration.

DOSE FORMS AND STRENGTHS

Multi-dose prefilled delivery device (pen) for subcutaneous injection containing 28 daily doses of 20 mcg.

PATIENT COUNSELING INFORMATION

Patients should read the FDA-approved Medication Guide and delivery device (pen) User Manual before starting therapy with FORTEO and re-read them each time the prescription is renewed. Patients need to understand and follow the instructions in the FORTEO delivery device User Manual. Failure to do so may result in inaccurate dosing.

The first endocrine-specific Practice Improvement Module (PIM), is a Web-based, self-evaluation tool designed to assist you in evaluating your care of patients with thyroid nodules. Using data from your practice, including patient charts, our PIM allows you to:

1) Evaluate your performance in evaluating thyroid nodules;
2) Compare your performance to ATA and AACE/AME/ETA clinical guidelines through personalized reports;
3) Create and implement an individualized improvement plan; and
4) Reassess the impact of that improvement plan on your practice.

Complete the PIM, either individually or as a part of a practice team, and earn 20 points toward the Self-Evaluation of Practice Performance (Part 4) requirement of Maintenance of Certification (MOC) and claim up to 20 AMA PRA Category 1 Credits™.

The alarming increase in type 2 diabetes mellitus (T2DM) among children and adolescents has researchers scrambling for effective treatments. Amid growing evidence that the disease progresses more quickly in children than in adults, some doctors are advocating aggressive drug treatment, and nearly all experts are stressing prevention as a priority to combat the condition.

“The time to intervene with major lifestyle changes is not after diabetes has happened,” said Kenneth Copeland, M.D., a pediatric endocrinologist at the University of Oklahoma. “Our focus needs to be on the kids who are at risk before they develop diabetes because effecting a major lifestyle change—enough to change the course of established diabetes in youth—is exceedingly difficult to do.”

Copeland is a co-author of the recent study, “Treatment Options for type 2 Diabetes in Adolescents and Youth...
(TODAY),” the first major trial to compare the effectiveness of three treatments for T2DM in young people. Results published in June in the New England Journal of Medicine showed that none of the treatments controlled glycemic levels in more than 61 percent of patients.

These findings are important, considering the increasing number of American youth with T2DM; from 2001 to 2009, the number of cases rose 21 percent. Some 3,700 children are diagnosed with the condition every year. Twenty years ago, T2DM was almost nonexistent among children, according to Philip Zeitler, M.D., Ph.D., a pediatric endocrinologist at Children’s Hospital Colorado in Aurora and professor of pediatrics and clinical science at the University of Colorado School of Medicine. He is another co-author of the TODAY trial.

The incidence of the disease is likely to continue to grow because of the obesity epidemic. Seventeen percent of children between the ages of 2 and 19 are obese. This puts a large segment of the population at risk for developing high blood pressure, high cholesterol, and T2DM. Developing T2DM at a young age also increases the risk of heart disease, retinopathy, and kidney disease.

With such dire medical complications facing the nation’s youth, TODAY researchers compared the efficacy of three treatments in maintaining glycemic control for a four-year period. One protocol used metformin, the standard treatment for children with T2DM; another treatment combined metformin with lifestyle intervention; and the third used metformin in combination with the insulin-sensitizing drug rosiglitazone. Failure of control was defined as the glycated hemoglobin, or A1C, level rising to 8 percent or more for six months.

Treatment with metformin alone failed 52 percent of the time, compared with a 47 percent failure rate for metformin plus lifestyle intervention and 39 percent for metformin and rosiglitazone combined. The researchers deemed the addition of lifestyle intervention not significantly different from metformin alone, but the two-drug combination led to a 25 percent improvement.

The 700 patients in the study were ages 10 to 17 years and had had T2DM for less than 2 years at study outset. Although the enrollment criteria specified that they have a body mass index (BMI) at or above the 85th percentile for age and sex, participants exceeded this requirement, with an average BMI in the mid-30s, putting them in the 98th percentile. After being weaned from any other diabetes medications, they were given a metformin dose of up to 1,000 mg twice daily to attain glycemic control, defined as a glycated hemoglobin level less than 8 percent for at least two months.

Because insulin sensitivity declines in all children during puberty and then improves at puberty’s end, researchers wanted to test whether aggressive steps to maintain insulin sensitivity might offer patients a safe passage through this period, Zeitler said. But they found that the failure rate of metformin monotherapy was higher in the children than in adults.

**Faster Progression of the Disease**

One of the reasons for this lack of efficacy could be that T2DM seems to progress more quickly in young people than adults, the researchers said in a presentation at the American Diabetes Association’s Scientific Sessions in June. By the end of the TODAY study, nearly one-third of the participants exhibited high blood pressure (compared with 12 percent at the beginning), 10 percent–30 percent had dyslipidemia, about 17 percent exhibited elevated urinary albumin levels (compared with 6 percent at the start), and 13 percent had retinopathy. These numbers represent a much faster progression of the complications of the disease than in adults.

In light of these results, “it might be good to start with a more aggressive drug treatment approach,” Zeitler said. “The good news is nearly 50 percent of the kids did well on metformin therapy.” Fortunately, patients who will respond well to metformin can be identified early on based on their A1C level, he said. “Those kids who had an A1C in the normal range did much better than those kids who got their A1C down but did not get a normal A1C. The kids you can get under control quickly and easily stay that way,” Zeitler explained. The median time to a loss of glycemic control was less than a year. If the drug is not going work, physicians will know fairly quickly.

A question arises about where to turn when metformin, the only oral drug approved by the U.S. Food and Drug Administration (FDA) for treatment of children, fails to ameliorate T2DM. Rosiglitazone, used in the study’s combination treatment, is not an option; in September
The TODAY researchers and other experts agreed that the failure of the lifestyle modification efforts should not be seen as reason to abandon them, but instead to redouble their efforts to help children adopt healthier habits. The lifestyle intervention treatment model required assigning a behavioral interventionist called a “pal” to each participant. The pals held weekly meetings with the children, advised their families on being role models, chaperoned trips to the gym to exercise, and more.

In general, the results were similar to previous adolescent weight-loss efforts and T2DM development. “Although metformin plus lifestyle intervention significantly decreased percent overweight, this did not translate into sustained glycemic control, as compared with metformin monotherapy,” the study said. Zeitler was surprised that the intervention was not able to budge the patients out of their overall environment of excess calories and a sedentary lifestyle enough to make a long-term difference.

“The key message from this study wasn’t so much about the need for add-on medications as it was about the need for prevention,” David Allen, M.D., head of pediatric endocrinology at the University of Wisconsin School of Medicine, told Endocrine News. “By demonstrating that a large proportion of children were not retrievable by medical intervention, as well as the accelerated rate at which they deteriorated in spite of medical intervention, this study should add a tremendous impetus to focusing our energy on correcting the dangerous mismatch of calories consumed versus energy expended that these children experience.” The focus on looking for more drug therapies could be a distraction from the need for prevention, he added.

Allen’s call for prevention echoed The Endocrine Society’s pediatric obesity clinical treatment guideline, which recommends physicians become much more active as community advocates for healthier school lunches, policies to ban advertising of unhealthful foods to children, and design of neighborhoods that emphasize walking instead of driving. School food programs are an important target because children who participate in the school lunch and breakfast programs consume one-third to one-fifth of their daily recommended caloric intake in school.

The Society’s guidelines also note that pediatricians are lax in complying with the American Academy of Pediatricians guidelines on obesity. Clinicians in general should be more proactive in screening for obesity and become involved with the entire family in prescribing dietary, physical activity, and behavioral modifications in pursuit of a healthier lifestyle.

Allen compared the challenge of the obesity epidemic with that of coping with climate change. Both issues, he said, are “so complex, embedded in culture and economics, and intertwined with conflicts between individual freedom and societal health that solutions are difficult to envision.”

ELIGIBLE PATIENTS:
- Adult patients with a confirmed diagnosis of Cushing’s disease
  - Mean UFC >ULN
  - Morning plasma ACTH within or above the normal range
  - MRI confirmation of pituitary adenoma (≥0.6 cm) or positive inferior petrosal sinus gradient for patients with a microadenoma <0.6 cm
  - Histopathological confirmation of an ACTH-staining adenoma in postsurgical patients
- Patients with de novo Cushing’s disease who are nonsurgical candidates

PRIMARY END POINT:
- The proportion of patients with drug-related grade 3 or 4 AEs or serious AEs

Pasireotide (SOM230) is an investigational new drug. Efficacy and safety have not been established. There is no guarantee that pasireotide will become commercially available.

Abbreviations: ACTH, adrenocorticotropic hormone; AEs, adverse events; bid, twice a day; MRI, magnetic resonance imaging; SC, subcutaneous; UFC, urinary free cortisol; ULN, upper limit of normal.

ClinicalTrials.gov Identifier: NCT01582061
If New York City Mayor Michael Bloomberg’s proposal to ban sugary drinks larger than 16 ounces passes this month, health advocates hope obese New Yorkers and other Americans as well will get the push they need to go from supersized to healthy portions.

Since the 1970s, American waistlines have been steadily increasing in direct proportion with food portion sizes in restaurants, food stores, and homes. Many food items have increased two to five times in size. Outside the home, almost all food portion sizes have increased, some—such as sodas and cookies—up to eight times. These sizes also exceed U.S. Department of Agriculture (USDA) and U.S. Food and Drug Administration standard portions. Small wonder that 66 percent of Americans are now overweight or obese, compared to 47 percent 30 years ago.

Research supports Bloomberg’s reasoning about portion control. Studies show that we tend to consume in units; if the food package is large, we consume the entire amount. We also tend to eat more when served more. “The more food you have in front of you, the more you are likely to eat,” George A. Bray, M.D., chief of the Division of Clinical Obesity and Metabolism at Pennington Biomedical Research Center in Baton Rouge and a leading obesity researcher, told Endocrine News. “This will be heightened if the foods are ones that you particularly like.”

The psychology at work here contributes to overconsumption; people often don’t realize they are eating more and they don’t necessarily feel fuller. In a 2003 “bottomless bowl” study, 54 participants ate soup from either a normal bowl or a bowl rigged to inconspicuously and automatically refill. The refilling bowl subjects ate a whopping 73 percent more than those with the normal bowl. The researchers concluded that a large portion size sends a subliminal message to our brains that this is the accepted norm, making it appropriate, even expected, for us to consume that amount. Such visual cues also tend to reduce our reliance on our own self-monitoring systems. Importantly, this psychological mechanism affects most people, whether obese or not.

Knowing that our consumption patterns have a distinctly psychological nature in addition to the physiologic drive, has an upside. We can “trick” ourselves into eating less almost as easily as we succumb to overconsuming. Research presented in 2010 at the Annual Meeting of the Society for the Study of Ingestive Behavior shows that cutting food into smaller pieces can reduce intake by creating the appearance of more food, which induces more rapid and increased satiety than single portions.

At the Hormone Health Network (www.hormone.org), health care providers offer a list of practical strategies for losing weight. A common theme among the items listed is changing what and how we eat, including eating less. Eating more slowly, for example, helps us eat less because it takes 20 minutes for the full signal from gut hormones, such as glucagon-like peptide-1 (GLP-1), cholecystokinin (CKK), and pancreatic polypeptide (PPY) among others, to reach the satiety center in the hypothalamus. Slowing down allows time for these hormones to do their work before those last forkfuls are taken.

In addition, said Caroline M. Apovian, M.D., director of the Nutrition and Weight Management Center at Boston Medical Center and professor of medicine at Boston University School of Medicine, “Eating slowly can increase the response of PYY and GLP-1 as compared to eating fast.” It can also reduce levels of the so-called “hunger hormone” ghrelin. “Compared with 15 chews, 40 chews results in lower caloric intake, lower postprandial ghrelin concentrations, and higher GLP-1 and CCK concentrations,” Apovian explained.

Other tips include getting adequate support, such as in a weight loss group, and keeping a food diary, both of which involve controlling portion size and, in turn, eating less.

Continued on page 38
WHAT CAN WEIGHT LOSS DO FOR YOU?

Losing weight can improve your health in a number of ways. It can lower your risk for type 2 diabetes, high blood pressure, stroke, and heart disease. Losing weight can also help you feel better.

There are proven ways to lose weight. You can find what works for you. Research has proven that changing eating habits and increasing physical activity (exercising) help people lose weight. Other strategies also can help. For example, you might find that rewarding yourself for exercising every day helps keep you motivated. Choose a non-food reward.

DID YOU KNOW?

Once you start eating, it takes 20 minutes for digestive hormones to tell your brain that you are full. For many people, eating slowly can help them eat less and still feel full.

THE DIABETES PREVENTION PROGRAM (DPP)

In this large study, researchers looked at what worked best for preventing type 2 diabetes. All of the people in the study were overweight. Results showed that people who lost a modest amount of weight through diet and exercise sharply lowered their risk for developing type 2 diabetes.

WHAT CHANGES IN EATING HABITS CAN HELP YOU LOSE WEIGHT?

Most people need to change what they eat and how much they eat in order to lose weight. Your health care provider can help you decide how to change your eating habits. Choices include:

- Eating fewer calories than usual. This strategy helped people in the DPP study lose weight.
- Eating a low-carbohydrate diet.
- Eating less fat. People in the DPP study cut down on fat.
- Choosing more foods that aren’t high in calories and low in nutrients. Eating foods such as non-starchy vegetables, some fruits, and broth soups help you feel full, even though you’re eating fewer calories.
- Using meal replacements, such as shakes or bars. They control serving sizes, eliminate decisions about food choices, and are easy to keep on hand.

Other healthy diets, such as the low-sodium DASH diet, also can help. The DASH diet is designed to lower blood pressure but you can also use it to lose weight. It includes fruits, vegetables, whole grain foods, low-fat or non-fat dairy foods, nuts, seeds, and lean meats, poultry, and fish.

WHAT KINDS OF EXERCISE CAN HELP YOU LOSE WEIGHT?

In general, many kinds of exercise will help you lose weight, especially when you exercise daily or most days of the week. Walking briskly (for about 30 minutes a day) is a good way to exercise. To help you stick with your plan, you should choose a type of exercise you enjoy. People in the DPP study exercised a total of 150 minutes each week, or about 20 minutes each day.

However, exercise alone (without limiting calories) usually isn’t enough to cause weight loss. But exercise plays an important part in helping people who have lost weight keep that weight off.
WHAT OTHER STRATEGIES CAN HELP YOU LOSE WEIGHT?

These actions also help:
• Weighing yourself every day
• Keeping daily food records of everything you eat and drink
• Eating breakfast every day
• Keeping the same eating patterns weekdays and weekends

Many people find that having support from other people helps them lose weight. You can get support by attending weekly group meetings or from weekly visits with a health care provider, such a registered dietitian.

CAN MEDICINES HELP WITH WEIGHT LOSS?

Studies show that anti-obesity medicines can help people lose more weight when combined with lifestyle changes (diet, exercise, and behavior change) than they can with lifestyle changes alone.

IS WEIGHT LOSS HARDER FOR PEOPLE WITH DIABETES?

Some studies show that weight loss is harder for people who have diabetes than for people who don’t. But you can still lose weight, even if you have diabetes.

WHAT SHOULD YOU DO IF YOU WANT TO LOSE WEIGHT?

Tell your doctor, dietitian, or diabetes educator that you’d like to lose weight. Work with your provider to make a plan. Make sure you’ve included a way to change what you eat and a way to exercise. To get ready, choose a date to start. Decide how you’ll reward yourself for doing what you’ve said you’ll do.

Most importantly, focus on what you can control. You can control what you eat and whether you go for a walk. But you can’t control how fast you lose weight. If you find that your plan isn’t working, it doesn’t mean you’ve failed. Instead, it means you should change your plan. Find a plan that works for you.

Questions to ask your doctor

• What is a healthy weight for me?
• Can you recommend a diet plan for me?
• Should I see a registered dietitian?
• Should I see a diabetes educator?
• What kind of exercise is best for me?
• How long will it take to reach my weight goal?

The Hormone Health Network offers free, online resources based on the most advanced clinical and scientific knowledge from The Endocrine Society (www.endo-society.org). The Network’s goal is to move patients from educated to engaged, from informed to active partners in their health care. This fact sheet is also available in Spanish at www.hormone.org/Spanish.
And, we can benefit from plain and simple education as well to remedy the all-too-common disconnect between portion size and serving size. Using vessels that show measurements is becoming a popular strategy to reduce intake. Measuring serving sizes and seeing what a cup, for example, really contains is an eye-opening experience for many people who previously estimated the capacity of a cup to be considerably larger.

The Portion Plate® demarcates a plate or placemat into appropriate serving sizes and pictorially compares serving sizes in many food categories to everyday items to facilitate remembering these sizes (for instance, 1.5 ounces of hard cheese = 3 dice.) WebMD offers downloadable template versions of a Portion Size Plate® in various sizes that can be carried in wallets or stuck to the front of the fridge. The USDA also provides similar services as part of their MyPlate program (www.choosemyplate.gov/).

A similar strategy involves re-packaging foods into smaller-volume containers, as Bloomberg seeks to do. If the supersize soda ban proposal becomes law and Big Apple residents shrink their drinks and their waistlines, it will be an inspiration for people across the nation to mind their plates.

Hosurth is a free-lance writer and editor in Baltimore.
As part of ongoing efforts to support a diverse and productive biomedical research workforce, The Endocrine Society recently contributed to a National Institutes of Health (NIH) initiative to increase support for underrepresented minorities in the biomedical research workforce.

NIH sought feedback from the scientific community after an August 2011 Science article titled, “Race, Ethnicity, and NIH Research Awards” raised concerns about opportunities for minorities. The article, which presents data correlating NIH R01 applicants’ race or ethnicity and the probability of receiving an award, shows that underrepresented minorities—including African Americans, Hispanics, and Native Americans—with doctorates in science and engineering make up less than 9 percent of occupations in these fields. Compared to their white colleagues, Asian scientists are 4 percentage points less likely to receive R01 funding from NIH, the article said. For African-American scientists, the probability of receiving funding is even less likely, falling at 13 percentage points below whites (see http://www.sciencemag.org/content/333/6045/1015).

In response to the article the NIH Advisory Committee to the Director (ACD) created a working group to examine diversity in the biomedical research workforce. Acting on the working group’s request, the Society sent a letter recommending specific actions that NIH can take to improve the participation and success of minorities in the field. Focusing on concepts that could enhance diversity throughout the biomedical research workforce pipeline, the Society suggested ways to bolster the success of minority grant applicants, including funding support for mentoring and career development programs. The Society also advocated for the development of a tracking system to monitor the progress of trainees throughout their careers. These recommendations are included in the working group’s final report to NIH. In addition, the report encouraged NIH to establish an Office of Diversity and a new ACD working group to further examine methods for reducing disparities in research awards.

The Society has long been a proponent of programs to increase opportunities for minorities in the biomedical research workforce and maintains a broad array of career development activities and programs specifically for underrepresented groups. Student outreach and professional development programs, mentoring and networking activities, and comprehensive summer research training programs are a few examples of the Society’s diversity portfolio.

A second NIH ACD working group was charged with recommending actions NIH could take to enhance training for all biomedical researchers—not just underrepresented minorities—while reducing overall training time. The Society’s response to this working group highlighted the importance of recognizing scientific work outside of academia. The Society encouraged NIH to assist institutions in providing training and career development opportunities to prepare trainees for a variety of careers, specifically recommending the inclusion of training related to business management, mentoring, and teaching science.

These recommendations were included in the working group’s final report to NIH, along with calls for the development of a more permanent research staffing model, for increases in the number of early career awards that NIH issues, and for limits on the amount of investigator, student, and postdoc salaries that can be charged to grants. The group also proposed that NIH undertake a closer examination of physician-scientist training.

The Society will continue to work with its members and the scientific community to advocate for equity in biomedical research and to develop programs and awards that support a sustainable, diverse biomedical research workforce.

Moore is the manager of science policy at The Endocrine Society.
BYDUREON: the first and only once-weekly treatment for type 2 diabetes

To learn more about BYDUREON through our Professional Education Programs, please visit www.BYDUREONHCP.com/ProfEd

Indication and Usage
BYDUREON is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus in multiple clinical settings.

- Because of the uncertain relevance of the rat thyroid C-cell tumor findings to humans, prescribe only to patients for whom potential benefits are considered to outweigh potential risk.
- Not recommended as first-line therapy for patients who have inadequate glycemic control on diet and exercise.
- Not a substitute for insulin, should not be used in patients with type 1 diabetes or diabetic ketoacidosis, and cannot be recommended for use with insulin.
- BYDUREON and BYETTA® (exenatide) injection both contain the same active ingredient, exenatide, and should not be used together.
- Exenatide has been associated with acute pancreatitis, including fatal and non-fatal hemorrhagic or necrotizing pancreatitis, based on postmarketing data. It is unknown whether patients with a history of pancreatitis are at increased risk for pancreatitis while using BYDUREON; consider other antidiabetic therapies for these patients.

BOXED WARNING: RISK OF THYROID C-CELL TUMORS
Exenatide extended-release causes an increased incidence in thyroid C-cell tumors at clinically relevant exposures in rats compared to controls. It is unknown whether BYDUREON causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans, as human relevance could not be determined by clinical or nonclinical studies. BYDUREON is contraindicated in patients with a personal or family history of MTC and in patients with Multiple Endocrine Neoplasia syndrome type 2 (MEN 2). Routine serum calcitonin or thyroid ultrasound monitoring is of uncertain value in patients treated with BYDUREON. Patients should be counseled regarding the risk and symptoms of thyroid tumors.

For additional safety profile and other important prescribing considerations, please see the adjacent pages for Brief Summary of Prescribing Information.
**WARNING: RISK OF THYROID C-CELL TUMORS**

Exenatide extended-release causes an increased incidence in thyroid C-cell tumors at clinically relevant exposures in rats compared to controls. It is unknown whether BYDUREON causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans, as human relevance could not be determined by clinical or nonclinical studies. BYDUREON is contraindicated in patients with a personal or family history of MTC and in patients with Multiple Endocrine Neoplasia syndrome type 2 (MEN 2). Routine serum calcitonin or thyroid ultrasound monitoring is of uncertain value in patients treated with BYDUREON. Patients should be counseled regarding the risk and symptoms of thyroid tumors (See Contraindications and Warnings and Precautions).

**INDICATIONS AND USAGE**

BYDUREON is an extended-release formulation of exenatide, administered as an injection once every seven days (weekly).

**Type 2 Diabetes Mellitus**

BYDUREON is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus in multiple clinical settings.

**Important Limitations of Use**

Based on postmarketing data, exenatide has been associated with acute pancreatitis, including fatal and non-fatal hemorrhagic or necrotizing pancreatitis. BYDUREON has not been studied in patients with a history of pancreatitis. It is unknown whether patients with a history of pancreatitis are at increased risk for pancreatitis while using BYDUREON. Other antidiabetic therapies should be considered in patients with a history of pancreatitis.

**CONTRAINDICATIONS**

Medullary Thyroid Carcinoma

BYDUREON is contraindicated in patients with a personal or family history of medullary thyroid carcinoma (MTC) or in patients with Multiple Endocrine Neoplasia syndrome type 2 (MEN 2).

**Hypersensitivity**

BYDUREON is contraindicated in patients with a prior serious hypersensitivity reaction to exenatide or to any of the product components.

**WARNINGS AND PRECAUTIONS**

Risk of Thyroid C-Cell Tumors

In both genders of rats, exenatide extended-release caused a dose-related and treatment-duration-dependent increase in the incidence of thyroid C-cell tumors (adenomas and/or carcinomas) at clinically relevant exposures compared to controls. A statistically significant increase in malignant thyroid C-cell tumors was observed in female rats receiving exenatide extended-release at 25-times clinical exposure compared to controls and higher incidences were noted in males above controls in all treated groups at ≥2 times clinical exposure. The potential of exenatide extended-release to induce C-cell tumors in mice has not been evaluated. Other GLP-1 receptor agonists have also induced thyroid C-cell adenomas and carcinomas in male and female mice and rats at clinically relevant exposures. In postmarketing studies, BYDUREON will cause thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans, as the human relevance of exenatide extended-release-induced rodent thyroid C-cell tumors could not be determined by clinical or nonclinical studies. Serum calcitonin was not assessed in the clinical trials supporting the approval of BYDUREON (see Warnings and Precautions). Serum calcitonin testing for patients treated with BYDUREON may simulate or mimic thyroid C-cell tumors and should be carefully evaluated. Serum calcitonin is a biological marker of MTC. Patients with MTC usually have calcitonin values >50 ng/L. Patients with thyroid nodules noted on physical examination or neck imaging should be referred to an endocrinologist for further evaluation. Routine monitoring of serum calcitonin or using thyroid ultrasound is of uncertain value for early detection of MTC in patients treated with BYDUREON. Such monitoring may increase the risk of unnecessary procedures, due to the low specificity of serum calcitonin testing for MTC and a high background incidence of thyroid disease. If serum calcitonin is measured and found to be elevated, the patient should be referred to an endocrinologist for further evaluation.

Acute Pancreatitis

BYDUREON is contraindicated in patients with severe renal impairment (creatinine clearance < 30 mL/min) or end-stage renal disease and should be used with caution in patients with renal transplantation. In patients with end-stage renal disease receiving dialysis, single doses of BYETTA 5 mcg were not well tolerated due to gastrointestinal side effects. Because BYDUREON may induce nausea and vomiting with transient hypoglycemia, treatment may worsen renal function. Use BYDUREON with caution in patients with moderate renal impairment (creatinine clearance 30 to 50 mL/min), BYDUREON has not been studied in patients with end-stage renal disease or severe renal impairment.

There have been postmarketing reports of altered renal function with exenatide, including increased serum creatinine, renal impairment, worsened chronic renal failure and acute renal failure, sometimes requiring hemodialysis or kidney transplantation. Some of these events occurred in patients receiving one or more pharmacologic agents known to affect renal function or hydration status such as angiotensin converting enzyme inhibitors (ACE inhibitors), antihypertensive drugs, or diuretics. Some events occurred in patients who had been experiencing nausea, vomiting, or diarrhea, with or without dehydration. Reversibility of altered renal function has been observed in many cases with supportive treatment and discontinuation of potentially causative agents, including exenatide. Exenatide has not been found to be directly nephrotoxic in preclinical or clinical studies.

**Gastrointestinal Disease**

Exenatide has not been studied in patients with severe gastrointestinal disease, including gastroparesis. Because exenatide is commonly associated with gastrointestinal adverse reactions, including nausea, vomiting, and diarrhea, the use of BYDUREON is not recommended in patients with severe gastrointestinal disease.

**Immunogenicity**

Patients may develop antibodies to exenatide following treatment with BYDUREON. Anti-exenatide antibodies were measured in all BYDUREON-treated patients in the five comparator-controlled 24-30 week studies of BYDUREON. In 6% of BYDUREON-treated patients, antibody formation was associated with an attenuated glycemic response. If there is compromising glycemic control or failure to achieve targeted glycemic control, alternative antidiabetic therapy should be considered.

**Hypersensitivity**

There have been postmarketing reports of serious hypersensitivity reactions (e.g. anaphylaxis and angioedema) in patients treated with exenatide. If a hypersensitivity reaction occurs, the patient should discontinue BYDUREON and other suspect medications and promptly seek medical advice.

**Macrovacular Outcomes**

There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with BYDUREON or any other antidiabetic drug.

**ADVERSE REACTIONS**

**Clinical Trial Experience**

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety of BYDUREON was assessed in five comparator-controlled 24-30 week trials of BYDUREON used as monotherapy or as add-on to metformin, a sulfonylurea, a DPP-4 inhibitor, or a combination of oral antidiabetic agents. In these trials, an event was classified as major hypoglycemia if there were symptoms of hypoglycemia with a concomitant glucose <54 mg/dl and the patient was able to self-treat. In the 26-week monotherapy trial of BYDUREON, 2.0% (95) (N=248), starglitate, 0.0% (0/0) (N=163), pioglitazone, 0.0% (0/0) (N=163), and metformin, 0.0% (0/0) (N=246). In the 26-week add-on to metformin trial: BYDUREON, 1.3% (0/3) (N=160); starglitate, 3.0% (0/12) (N=166), and pioglitazone, 1.2% (0/3) (N=163). In the 26-week add-on to metformin or metformin plus sulfonylurea trial: concomitant sulfonylurea, BYDUREON, 0.0% (0/0) (N=70) and titrated insulin-glargine, 43.3% (2.87) (N=66); without concomitant sulfonylurea, BYDUREON, 3.7% (0.11) (N=163) and titrated insulin glargine, 10.1% (0.64) (N=157). Insulin glargine was dosed to a targeted fasting glucose concentration of 72 to 100 mg/dl. The mean dose of insulin glargine was 10 units/day at baseline and 31 units/day at endpoint. In the 24-30 week trials of BYDUREON as monotherapy or add-on to metformin, sulfonylurea, thiazolidinedione or any combination of these oral agents, incidence (% of subjects) and rate (episodes/subject/year) of minor hypoglycemia were as follows. In the 24-week trial: with concomitant sulfonylurea, BYDUREON, 12.5% (0.72) (N=40) and BYETTA, 11.7% (0.31) (N=34); without concomitant sulfonylurea, BYDUREON, 0.0% (0/0) (N=89); and BYETTA, 0.0% (0/0) (N=89). In the 10-week trial with concomitant sulfonylurea, BYDUREON, 14.5% (0.51) (N=155) and BYETTA, 15.4% (0.37) (N=52); without concomitant sulfonylurea, BYDUREON, 0.0% (0/0) (N=9) and BYETTA, 1.1% (0.02) (N=9). There were no reported events of major hypoglycemia in these five comparator-controlled 24-30 week trials. Major hypoglycemia was defined as loss of consciousness, seizure or coma (or other mental status change consistent with neuroglycopenia in the judgment of the investigator or physician) which involved after administration of glucagon or glucose or required third party assistance to resolve because of severe impairment in consciousness or behavior. Patients were to have a concomitant glucose <54 mg/dl.

**Immunoresponse**

Anti-exenatide antibodies were measured at preroged intervals (4-14 weeks) in all BYDUREON-treated patients (N=918) in the five comparator-controlled studies of BYDUREON. In these five trials, 452 BYDUREON-treated patients (49%) had low titer antibodies (<125) at exenatide at any time during the studies and 405 BYDUREON-treated patients (45%) had low titer antibodies to exenatide at study endpoint (24-30 weeks). The level of glycemic control in these patients was generally comparable to that observed in the 379 BYDUREON-treated patients (41%) without antibody titers. An additional 107 BYDUREON-treated patients (12%) had high titer antibodies at endpoint. Of these patients, 56% (60 overall) had an attenuated glycemic response to BYDUREON (0.7% reduction in HbA1c, the remaining 57% (60 overall) had a glycemic response comparable to that of patients without antibodies. In the 30-week trial in which anti-exenatide antibody analyses were performed at baseline and at 4-week intervals from week 6 to week 30, the mean anti-exenatide antibody titer in the BYDUREON-treated patients peaked at week 7 then declined by 56% from peak by week 30.

Teaching Experience Can Expand Your Career Options

By Robert K. Dearth

For many doctoral candidates and postdoctoral trainees, securing a tenure-track faculty position at a college or university is essential. The reality is that you will be competing for an ever-decreasing number of faculty positions. Having prior college teaching experience is one way to gain a competitive advantage. Yet acquiring teaching experience is not always accommodated in doctoral and postdoctoral programs where the priority must be given to mastering the skill-set needed to become a successful independent researcher. After all, that is why you spend countless hours in the lab, living off caffeine or energy drinks. College teaching experience, however, can set you apart and expand your career options.

At many, if not most, post-secondary institutions, entry-level tenure-track assistant professor positions expect faculty to teach, do research, and engage in service activities. This is especially true in the current climate of tight budgets and reduced state funding for public colleges and universities. Effective teaching may also provide an added level of career security in the competitive environment of acquiring external research funding.

Data from the U.S. Department of Education Integrated Postsecondary Education Data System (IPEDS; www.nces.ed.gov/ipeds/datacenter) show that of the 4,371 new tenure track hires from 2006–2010, 75 percent (3,285) of the new hires were at “teaching universities” with 1,086 new tenure track hires at “research universities.” At “research universities,” your research experience and success will make you a desirable hire. At “teaching universities,” your research experience and success will make you a desirable hire. At “teaching universities,” research may still be an important component, but a strong emphasis will be placed on your ability to teach. Many of these universities will not give serious attention to candidates without prior college teaching experience. Clearly, adding teaching experience to your basic science training will make you more competitive in your quest for a faculty position.

As a science trainee your primary focus should remain on science and research. Acquiring teaching experience can be accomplished at the same time. Teaching should serve to strengthen your training portfolio and create more career opportunities. Teaching can also provide you with insight and knowledge that can advance your research.

Attend ENDO’s Trainee Day

The most opportune time to gain valuable teaching experience is probably during your graduate training. One of the easiest ways to learn how teaching can impact your career is to attend the Endocrine Trainee Day at The Endocrine Society’s Annual Meeting. ENDO’s Trainee Day provides valuable informational sessions about teaching and research in academia. For individuals who are in graduate studies at undergraduate degree-granting universities, being a teaching assistant (TA) for a defined length of time (at least a semester) is a great way to gain experience and might be a requirement for the degree. Being a TA can also help support your graduate studies.

For individuals in a graduate pro-
gram at institutions that don’t have an undergraduate program (such as medical schools and health science schools) getting in front of the class can be a little more difficult. My best advice, if teaching is not a part of your program, is to talk to your mentor and other professors about your desire to assist in a course, perhaps as a guest lecturer. Getting some level of classroom experience can help you decide if this is a desirable aspect of your training. Furthermore, some undergraduate universities and colleges will hire recently granted Ph.D.s with little or no postdoctoral training if they have had teaching experience as a graduate student. Understand that if you do accept a primary teaching position, with little or no research requirement, you must be sure that you want a career with a focus on teaching. The longer you are away from the bench, the more difficult it is to transition back into research.

It becomes increasingly difficult to gain valuable teaching experience as you progress in your training. If you are looking for a postdoctoral position and have decided that you want some level of classroom teaching, you should try to get teaching experience before accepting the position. Being honest and upfront with your potential mentor will be beneficial to both of you.

Adjunct Teaching Opportunities

Several institutions now offer postdoctoral training programs specifically for basic scientists that include classroom teaching. These programs include adjunct teaching positions at area universities and community colleges and are the best training program for individuals wishing to obtain a tenure track position that requires a heavy teaching load.

If you are a current postdoctoral fellow and chose the position based on the research opportunity, remember your mentor is there to facilitate your desire to become a researcher and it is not his or her responsibility, nor the institution’s, to help you gain teaching experience. My advice is first to establish yourself in the lab, stay committed to your research, mentor students, continue to publish, and seek funding. Once you are comfortable with your research progress, talk to your mentor about your desire to take on a teaching load and assure him it will not detract from your responsibilities in the lab.

Overall, adding teaching to your training portfolio will make you a more rounded potential hire. Better yet, you may actually discover that one of your biggest contributions to science is teaching future scientists.

Robert K. Dearth, Ph.D., is an assistant professor of biology at the University of Texas-Pan American in Edinburg, Texas.

NOW AVAILABLE!

ESAP™ 2012

The Endocrine Society’s Premier Self-Assessment Resource

Based on the ABIM blueprint for certification, ESAP 2012 is the perfect tool for physicians seeking certification or recertification, and clinicians simply wanting a self-assessment and a broad review of endocrinology.

ESAP 2012 provides 160 online interactive case-based questions and printed book. Each question features extensive discussion of correct and incorrect answers. Written by leaders in the field, ESAP 2012 is designed to ensure you have the latest information from the experts.

To register or purchase ESAP 2012, visit: www.endocrineself-assessment.org, to order by phone call 1.888.363.6762 or 301.941.0210 Monday–Friday, 8:30 a.m.–5:00 p.m. ET.

List Price: $350  Member Price: $250  Member Fellow: $199

© 2012 THE ENDOCRINE SOCIETY®
**Important Safety Information**

CYCLOSET® is contraindicated in patients with hypersensitivity to ergot-related drugs, bromocriptine, or any of the excipients in CYCLOSET®. Do not use in patients with syncopal migraines. It may precipitate hypotension. Do not use in nursing women. It may inhibit lactation. There are postmarketing reports of stroke in this patient population.

CYCLOSET® can cause orthostatic hypotension and syncope, particularly upon initiation or dose escalation. Use with caution in patients taking antihypertensive medications. CYCLOSET® may exacerbate psychotic disorders or reduce the effectiveness of drugs that treat psychosis. Use in patients with severe psychotic disorders is not recommended. CYCLOSET® may cause somnolence. Advise patients not to operate heavy machinery if symptoms of somnolence occur. Concomitant use with dopamine antagonists such as neuroleptic agents is not recommended.

There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with CYCLOSET® or any other antidiabetic drug. CYCLOSET® does not increase the risk of macrovascular events. In controlled clinical trials, adverse reactions reported in ≥5% of patients treated with CYCLOSET®, and reported more commonly than in patients treated with placebo, included nausea, fatigue, dizziness, vomiting, and headache.

Safety and effectiveness have not been established in pediatric patients.

**CYCLOSET®** is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus.

Please see adjacent Brief Summary of Prescribing Information.

**Improved glycemic control**

- 0.6% to 0.9% A1C reductions seen when added to other oral agents†

**Demonstrated CV safety profile**‡

- 42% relative risk reduction for composite CVD endpoint§ vs placebo.
  Hazard ratio=0.58 (95% CI, 0.35-0.96); P<.05

---

CYCLOSET is a dopamine receptor agonist indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes.

*Preclinical studies suggest that appropriately timed daily administration of bromocriptine, the active ingredient of CYCLOSET, may positively affect hypothalamic activities associated with insulin resistance and glucose intolerance. In clinical studies, morning administration of CYCLOSET improved glycemic control in adults with type 2 diabetes without increasing plasma insulin concentrations. The precise mechanism of action of CYCLOSET is unknown.*

†Findings from a 52-week, randomized controlled trial to evaluate the safety and efficacy of CYCLOSET. Data shown are from a prospective 24-week assessment for treatment differences in the change from baseline to Week 24 in A1C among subjects with a baseline A1C ≥7.5% (average baseline A1C of 8.3%), taking 1 or 2 OADs, and completing 24 weeks of therapy. In the intent-to-treat, LOCF population, A1C reductions in the CYCLOSET arm vs placebo were 0.5% for patients failing any OAD, 0.5% for patients failing metformin ± OAD, 0.5% for patients failing metformin + SU ± OAD, and 0.6% for patients failing TZD ± OAD.

‡In a 52-week, randomized clinical trial of 3,070 patients, CYCLOSET was not associated with an increased risk for adverse cardiovascular events.

§Prespecified composite CVD endpoint of time to first MI, stroke, coronary revascularization, hospitalization for unstable angina, or hospitalization for CHF.

---

**Reference:** Data on File. Santarus, Inc.

CV=cardiopulmonary; CVD=cardiovascular disease; OAD=oral antidiabetic therapy; LOCF=last observation carried forward; SU=sulfonylurea; TZD=thiazolidinedione; MI=myocardial infarction; CHF=congestive heart failure.
was 32 kg/m².

In the pooled CYCLOSET phase 3 clinical trials (CYCLOSET N = 2298; placebo N = 1266), gastrointestinal adverse events, particularly nausea, were reported in 38% of CYCLOSET-treated patients and 32% of the placebo-treated patients prematurely discontinued treatment. In the CYCLOSET safety trial, hypoglycemia was defined as blood glucose <50 mg/dL (or evidence of prompt resolution of these symptoms with appropriate intervention, 2) symptoms with a measured glucose <60 mg/dL or 3) measured glucose was not measured). In this trial, severe hypoglycemia was reported among 0.5% of the CYCLOSET-treated patients and 0.3% of the placebo-treated patients. In the CYCLOSET safety trial, 1.6% of CYCLOSET-treated patients and 1.2% of the placebo-treated patients reported orthostatic hypotension as an adverse event. In the pooled phase 3 clinical trials, 601 of the 2,054 CYCLOSET-treated patients (29%) were ≥65 years old. No overall differences in safety were observed between older and younger patients. The concomitant use of other medications may cause an increased risk of adverse effects of CYCLOSET in older patients, particularly those with renal or hepatic impairment.

15.2.3 Somnolence:

In the phase 3 clinical trial, somnolence was reported in 1.6% of CYCLOSET-treated patients and 0.7% of placebo-treated patients. The incidence of somnolence in the placebo-controlled trials of oral dopamine receptor agonists, including bromocriptine mesylate for these indications, generally at doses higher than those approved for the treatment of Parkinson’s disease. In the pooled phase 3 clinical trials, somnolence was reported in 1.6% of CYCLOSET-treated patients and 0.7% of placebo-treated patients. In the phase 3 clinical trial, somnolence was reported in 1.6% of CYCLOSET-treated patients and 0.7% of placebo-treated patients. Of the reports of nausea or vomiting were described as serious. There were no differences in the pattern of common adverse events across race groups or age groups (<65 years old vs. ≥65 years old).

15.2.4 Interaction with Dopamine Receptor Antagonists:

Interaction with dopamine receptor antagonists, including neuroleptic agents that have dopamine receptor antagonistic properties (eg, chlorpromazine, thioridazine), may reduce the effectiveness of CYCLOSET. In the pooled phase 3 clinical trials, neuroleptic agents were used during pregnancy only if clearly needed. When male rats were given oral doses of 2, 10 or 50 mg/kg/day (up to 120 times the human 4.8 mg daily dose, based on mg/m²) during gestation days 6-18, there was a 13% incidence of spontaneous abortion (11% in females and 2% in males). In rabbits treated from gestation day 6-18 with oral doses of 3, 10, and 30 mg/kg/day (up to 120 times the human 4.8 mg daily dose, based on mg/m²), there was a 6% incidence of spontaneous abortion (5% in females and 14% in males). In rats treated with a single dose of 10 mg/kg on gestation day 5, implantation was inhibited at 10 and 30 mg/kg (48% and 60% inhibition, respectively). In mice, implantation was not affected at oral doses up to 50 mg/kg (15 times the human 4.8 mg daily dose, based on mg/m²).

15.3.3 Adverse Events Reported in Phase 3 Clinical Trials of CYCLOSET (≥5% of Patients Pretreated with an Oral Anti-Diabetic Agent and Randomized to Recei...}

The following studies will be published in Endocrine Society journals. Before print, they are edited and posted online in each journal’s Early Release section. You can access the journals via www.endo-society.org.

**Endocrinology**

- Males with familial hypertrophic cardiomyopathy should avoid phytoestrogens.

  Haines CD, Harvey PA, Luczak ED, et al. Estrogenic compounds are not always cardioprotective and can be lethal in males with genetic heart disease.

- This new stem cell methodology could provide future therapies for patients with adrenal insufficiency.

- AMH knock-down may have therapeutic value in infertile women who respond poorly to ovarian stimulation.

  Campbell BK, Clinton M, Webb R. The role of anti-müllerian hormone (AMH) during follicle development in a monovulatory species (sheep).

- PPARγ expression in pancreatic β-cells is unlikely to be directly essential for normal β-cell function or the insulin-sensitizing actions of rosiglitazone.

- TH signaling in tadpoles is active even before thyroid formation, suggesting an early sensitivity to endocrine-disrupting chemicals.

**Molecular Endocrinology**

- Using small molecules or IGF-I/IGF-II antibodies might aid in avoiding anti-IGF-IR resistance in EWS patients.

- New molecular mechanisms are suggested for the functional withdrawal of progesterone at term labor.

- Lung cancer incidence and treatment approach could be predicted by NR expression.

**The Journal of Clinical Endocrinology & Metabolism**

- Sedation and anesthesia can induce a significant rise in cortisol in children.

- The need for hormone replacement therapy should be re-evaluated three months after surgical correction of NPH because most endocrine dysfunctions are reversed in this time.

  Moin T, Bergsneider M, Vespa P, Heaney A. Pituitary function in patients with normal pressure hydrocephalus before and after neurosurgical correction.

- Runx-related transcription factor 2 potentiates the migration and invasive capacity of thyroid tumor cells.

  Sancisi V, Borettini G, Maramotti S, et al. Runx2 isoform I controls a panel of pro-invasive genes driving aggressiveness of papillary thyroid carcinomas.

- Circulating myostatin levels in men are associated with seasonal changes, age, body mass index, fat mass, smoking, and 25-hydroxycholecalciferol levels.

- Physical activity promotes favorable estrogen metabolism that could lead to prevention of chronic diseases such as breast cancer and osteoporosis.

**Hormones and Cancer**

- Endometrial cancer risk is not associated with migraine history and NSAID use.

HHN Joins Forces with Menopause the Musical®

For women going through the “change of life,” managing menopausal symptoms is no laughing matter: A recent national survey by the Hormone Health Network found that 72 percent of women experiencing troublesome symptoms have not received treatment, and another 60 percent are not discussing treatment options with their doctor. To help bridge this conversation gap, the Network teamed up with Menopause the Musical®, a light-hearted look at four women coping with their menopausal symptoms, at the Warner Theater in August to introduce the Menopause Map to its Washington, D.C., audience. Attendees had the opportunity to complete the online, interactive Map on-site, and received the Networks’ patient fact sheets on menopause.

Third Annual Endocrine Summit in India

On September 30, The Endocrine Society will present the third Annual Endocrine Summit in India. This program, held in Mumbai, will bring together more than 200 of India’s endocrinologists for an interactive platform that provides a comprehensive review of best practices and evidence-based strategies in the field of endocrinology. Attendees will gain insight into the evaluation and management of patients with endocrine disorders and diseases. Presented by world-renowned faculty, the 2012 program will include female reproduction and pituitary, thyroid, and adrenal disorders. The faculty is comprised of Past President Janet Hall, M.D., past Annual Meeting Steering Committee Chair Lynnette Nieman, M.D., David Cooper, M.D., and David Clemmons, M.D.

FLARE Ignites Careers of Young Professionals

The Endocrine Society is pleased to announce the launch of the Future Leaders Advancing Research in Endocrinology (FLARE) program, which will provide leadership development training to senior graduate students and postdoctoral and clinical fellows from underrepresented communities. The FLARE program is funded by a grant from the National Institute of Diabetes and Digestive and Kidney Diseases. More information can be found at www.endo-society.org/FLARE.

Endocrine Education in Your Backyard

The Endocrine Society brings top-quality clinical updates to your area with Endocrine Essential Live. This new regional series features two programs designed for both professional endocrinologists and for primary care physicians treating endocrine-related diseases.

Endocrine Essentials Pro, chaired by Lisa Fish, M.D., is designed for endocrinologists and focuses on metabolic bone disease and adrenal disorders.

Endocrine Essentials for Primary Care, chaired by Rocio Pereira, M.D., is a diabetes program for internists, general practitioners, diabetes educators, and other primary care providers.

These programs are scheduled for the following towns and dates: Minneapolis on September 29, Kansas City, Missouri, on October 20, Indianapolis on October 27, and New York City on November 10.

These concurrent half-day programs provide state-of-the-art updates on current practice challenges from expert faculty. More information and registration is available online at www.endo-society.org/eelive.

<td>The Strelitz Diabetes Center and Division of Endocrinology and Metabolism, at the Eastern Virginia Medical School are seeking an Endocrinologist at the Assistant or Associate Professor rank (tenure track). The candidate will participate in clinical and educational activities of the division, and will have completed an endocrinology fellowship and be BC/BE in Internal Medicine and Endocrinology. Opportunities for program development include diabetes education, inpatient glucometrics and thyroid cancer management. We are seeking an individual to join our group with interests in quality and the development of innovative clinical programs focusing on early intervention. The successful candidate will become an integral part of a system of care, working with our primary care network and multiple specialties to enhance diabetes care. The position includes a faculty appointment, teaching opportunities and a competitive salary and benefit package. Previous experience with thyroid ultrasound preferred. The search committee will also consider applicants with an active research program focused on aspects related to diabetes or thyroid disease. There are excellent laboratory facilities available and possible start up package. The historic port city of Norfolk is centrally located in the 1.8 million person Hampton Roads area on the Chesapeake Bay, a short drive from the Virginia Beach oceanfront. Forward CV to: <a href="mailto:HRapps@evms.edu">HRapps@evms.edu</a>. EVMS is an Equal Opportunity/Affirmative Action Employer/M/F/D/V and a Drug and Tobacco Free workplace.</td>

### Need to hire an endocrinologist?

**EndoCareers is the answer.** Advertise here for great results!  
www.endocareers.org  
800-361-3906

---

### People. Passion. Community. It all comes together here.

There’s a simple reason you chose a career in medicine. **We invite you to practice it.**

We welcome your enthusiasm for compassionate medicine as you change lives with some of the most inspiring people you will ever meet. Join a team of two Endocrinologists and 2 Nurse Practitioners who practice 100% consultative endocrinology and enjoy excellent physician support, flexible scheduling, and 1:4/5 call with Hospitalist support. We offer an above average compensation package that includes income guarantee, production bonuses, and relocation/residency stipend/loan repayment options. Your practice and your family will flourish in Wausau, WI; a safe and friendly community that offers a low cost of living.

**In return, we promise to treat you with the same dignity and respect you give to your patients.**

Respecting your work/life balance is a big part of the Aspirus culture. We will surround you with a highly qualified nursing and support staff, an extensive network of outstanding specialists, and a medical culture that shares an unyielding commitment to excellence.

**A practice model like this could only happen in a place like this.** It’s a place where kayakers and theatergoers live in harmony. A place of adventure through all four seasons. A place good natures and great schools call home.

Details at AspirusProviderOpps.org.

OCHSNER HEALTH SYSTEM in New Orleans is searching for a BC/BE ENDOCRINOLOGIST to join our staff at Ochsner Baptist Medical Center. Candidates with experience or directly from training are welcomed to apply. Areas of interest should include general endocrine disorders, diabetes, and endocrine disorders as related to pregnancy. This position is mainly outpatient-based but will serve a large Ob/Gyn group with significant inpatient consultation. Salary is competitive and commensurate with experience and training.

Ochsner Baptist Medical Center, with a deep-rooted history in Uptown New Orleans, is a fully accredited, full-service hospital staffed by more than 390 physicians. We have all private rooms, an ICU, thirteen operating rooms, and a state-of-the art imaging center. We are proud to be distinguished by our excellence in specialty care and high patient satisfaction scores. Our newly renovated 24-hour full-service emergency department is staffed by a team of board-certified ER physicians.

The Ochsner Health System is comprised of 8 hospitals and more than 38 clinics across southeast Louisiana which sees over 1.5 million clinic patient visits annually. Ochsner is a major provider of graduate medical education with 23 ACGME accredited residency and fellowship programs including our Endocrinology fellowship program.

New Orleans is a cosmopolitan, historic city with a pleasant climate, unique architecture, multiple medical schools and academic centers, professional sports teams, world-class dining and cultural interests, and world-renowned live entertainment and music.

Please email CV to: ochsnerphysiciancv@gmail.com Ref. # ABEND01 or call 800-488-2240 for more information. EOE.
The Department of Internal Medicine of the Ohio State University College of Medicine seeks to recruit a Director for the Division of Endocrinology, Diabetes and Metabolism. The ideal candidate will be a visionary leader interested in building upon the division’s strengths to expand its tripartite mission in clinical care, medical education and research excellence. The new Division Director would be expected to lead the division in achieving its vision of translating knowledge to improved care of endocrine and metabolic disease, mentoring faculty to support their career success, and collaborating across divisions, departments, centers and colleges at one of the nation’s most comprehensive universities and one of the largest academic health sciences campuses.

The Department is interested in strong candidates who have demonstrated commitment to excellence by providing leadership in teaching, research, and clinical service. Experience in building and/or supporting innovative clinical programs would be a strength. Applicants with mature research programs in basic, clinical or translational research are encouraged to apply. A track record of mentoring trainees for successful academic careers or supporting the career development of faculty is desirable as recruitment of additional faculty aligned with research, clinical and educational missions is anticipated.

The Division currently consists of 15 faculty whose clinical expertise spans a broad scope of general endocrinology and diabetes while supporting individuals focusing in diabetes, obesity, thyroid cancer, adrenal disorders, and bone health. Areas of research excellence include strong multidisciplinary research programs in thyroid cancer, diabetes, neuroendocrine tumors and women’s musculoskeletal health. In addition, Ohio State offers many unique opportunities for collaboration including the Comprehensive Cancer Center, The Center of Clinical and Translational Science, The Davis Heart and Lung Research Institute, Transplant Medicine and Bariatric Surgery among others. High quality clinical care is maintained through focused quality improvements, optimized electronic health records, cross-disciplinary teams and support staff. Post-graduate training includes a GME accredited fellowship program, and rotating residents in outpatient clinics and inpatient consultative services. The division is active in Ohio State’s innovative Lead.Serve.Inspire Curriculum for the medical students. The division is currently ranked in the top 20 by the U.S. News & World Report.

Candidates should be eligible for Associate Professor rank or above. To apply for the Division Director for the Division of Endocrinology at the Ohio State University Wexner Medical Center, submit a confidential inquiry, nomination, referral, or application to:

Dan Dolan, Director of Senior Leader Recruitment for the OSU Medical Center
660 Ackerman Road, P.O. Box 183100, Columbus, OH 43218-3100.
Dan.Dolan@osumc.edu 614-293-4513

To build a diverse workforce, the Ohio State University Wexner Medical Center encourages applications from individuals with disabilities, minorities, veterans, and women. Ohio State is an EEO/AA Employer.
A Second Look at the Military Medical Museum

By Marian Smith Holmes

Weird. Quirky. Eew! Such are the knee-jerk assessments people often make when they hear about the National Museum of Health and Medicine (NMHM). Yes, the exhibitions include a massive human hair ball, a huge elephantiasis leg and diverse organs preserved in formaldehyde. But the 150-year-old museum, just outside Washington, D.C., is in truth an extensive collection of medical artifacts and an impressive educational facility. Even those exhibits that sound creepy are grounded in real science.

Scientific research was the museum founder’s original intent when it was established during the Civil War. “Forward… all specimens of morbid anatomy,” U.S. Army Surgeon General William A. Hammond instructed field doctors in 1862, soliciting contributions to the new Army museum dedicated to the study of military medicine and surgery.

“I have numerous specimens for you,” a Union surgeon replied. “Have put them in ale barrels with some whisky & chlorinated soda.” Bone fragments, pieces of tissue and other specimens from the battlefields poured in along with photos of wounded soldiers and handwritten accounts of case studies and surgical procedures.

As gruesome as the collecting may seem to modern sensibilities, it represented research at its most basic level. Often called the first modern war, the Civil War was fought with technologically advanced weaponry that left young men with horrible new injuries that taxed the ingenuity of field surgeons. More than anything the museum demonstrates how the horrors of war created urgency in the development of medicine. “This is the place death delights to help the living,” a sign on one NMHM wall proclaims.

“It was essentially the first government-sponsored medical research project in the United States,” says Laura Cutter, the museum’s archivist. The battlefield collection became the basis for the six-volume Medical and Surgical History of the War of the Rebellion, 1861–65, a government publication detailing tens of thousands of diseases, wounds, and surgeries. Not only was it “highly valuable” to doctors for practical information, Cutter says, but it also statistically documented the occurrence of diseases. Based on the compilation, “the primary cause of military death during the war was diarrhea and dysentery,” she adds.

In addition to housing 25 million artifacts, which include thousands of preserved organs and skeletal specimens, the museum showcases narratives about individuals who made
a difference. An exhibition about Dr. Mary Edwards Walker, a surgeon in Union battlefield hospitals, contains her surgical kit, a small leather case about the size of a make-up bag. The Army's first female surgeon, she was once captured by the Confederates but she returned to the battlefield soon after she was released. She was later awarded the Medal of Honor, the first and only woman to ever receive it. Also on display is the beautifully crafted leather and gold microscope of 17th century scientist Robert Hooke, who used it to observe organisms that he described and illustrated in his book, *Micrographica*, a revolutionary scientific text at the time. Fascinated by the microscopic images, he coined the biological use of the word “cell.”

A display of prosthetic limbs illustrates the advances made over the years to get war amputees functioning again; a similar display charts the history of facial reconstruction. Though steeped in Civil War history, the museum continues to collect, creating exhibitions of recent military medical innovations. One installation features a section of an emergency room tent used in Iraq. A traumatic brain injury exhibition displays computerized equipment alongside instruments from the 1800s, and a forensics exhibition tracing the evolution of the science so critical to identifying the fallen in battle includes the Sept. 11 tragedy.

Over the years, the museum has undergone name changes and numerous relocations. From 1971 to 2011 it was housed in the Walter Reed Army Medical Center, which was then located in Washington, D.C. A year ago NMHM moved into its own brand new building in Silver Spring, Maryland. It remains a destination for researchers, but is a favorite of families and, yes, curiosity seekers.

Versatility in a Complete Package.

MILLIPLEX® MAP magnetic bead-based immunoassay kits & MAGPIX® instruments.

Research can change direction in a minute—to keep the pace, you need a versatile assay platform.

With our analytically validated MILLIPLEX® MAP kits, using Luminex® xMAP® technology, measure one analyte per sample or fifty, in research areas including neuroscience, toxicity, oncology—using preconfigured or customized panels.

And, the versatility doesn’t stop there—we’re the original multiplex partner offering the full range of multiplex instruments, including MAGPIX®, the newest, most flexible small-footprint instrument for the user-friendly xMAP® platform.

Get the complete package at www.millipore.com/magbeads
NEW! Endo Pubs App
The Endocrine Society’s Full-Text Multi Journal App

Available for both iOS and Android platforms

Now you can read your Endocrine Society journals anywhere, anytime with the Endo Pubs App. Get instant access to these features and many more:

• Download, search, view, and save abstracts and full-text articles
• Full-text search on abstracts, title, authors, and keywords
• Social sharing: Facebook and Twitter posts
• Access supplemental material

Available at Apple App Store and Android Market.
